EXPLANATORY NOTES:

SUMMARY:

This matrix is prepared and published monthly, representing what happened in various sectors in the particular reference month. This indicators matrix is a step towards showing a comprehensive picture of the current situation in Gambella region and establishing a basis for initial trend and gap analysis. In order to better understand the matrix, following are the explanatory notes on some of the sector indicators:

NUTRITION:

- All recovery rates for both SAM (OTP) and MAM (TSFP) are well within the SPHERE standards of performance.

SHELTER:

- ‘Transitional shelters’ refers to those that have been completed with mud plastering. However, more transitional shelters are still under construction and will be updated in the matrix once they are completed.
- Due to flooding in Leitchuor and Nip Nip camps, only a minimum of the transitional shelters constructed are habitable. Most households have been provided with family tents or emergency shelters however most of the households have self-settled outside the camps on higher grounds within the host community.
- Entry points and transit centers are all with communal hangers and therefore not included in the matrix. The indicators are based on the total number of registered households.
- Okugo and Pugnido shelter data shown in the matrix is for the new caseload displaced post 15 December 2013. Relocation to Pugnido from Mattar and Pagak is ongoing.

WATER, SANITATION AND HYGIENE (WASH):

The WASH indicators have been generally maintained and slightly improved in the period from primo January to primo February:

1. Significant improvement was observed in Leitchuor refugee camp on sanitation coverage and decreasing in kule and Tierkidi camps due to high filling rate of latrines
2. Water coverage was slightly dropped down in Kule and Tierkidi camps due to the health incident which occurred on 17th November in Kule camp and stopped water supply for consecutive four days.

Other important points:

- The indicators for the camps are broadly administrative indicators i.e. the indicators are currently relying on total camp population (entire protected refugee population) as the denominator however indicators for entry points/transit centers are calculated on the population actually residing in the camp and accessing WASH services being offered.
- At entry points and transit centers, we normally have varying refugee numbers characterized by spikes and valleys, which requires a delicate balance on maintaining an optimal level of infrastructural investment to ensure that resources are not misappropriated. Ideally, refugees are not expected to have a prolonged stay, and when this happens it affects the level of WASH assistance accessible.

EDUCATION:

The education indicators for Gambella continue to show a 1% decline in the period from primo January to primo February 2015.

1. The overall enrolment rate for the age group 3-18 has dropped from 54% to 53%.

a) Enrolment for Early Childhood Education (3-6 years-old) remains weak for the three camps of Kule, Tierkidi and Leitchuor and is now at 35% which has slightly gone down by 1% as compared to previous month.

b) Primary enrolment - A slight increase has been noted in this category. However, it must be noted that the enrolled in many cases are above the target age of 7-14, which is statistically somewhat misleading.
2. Boys’ enrollment remains higher than girls enrollment with a 11% gap between the two.
3. Secondary Education enrolment in Pugnido camp remains same at 20% as previous month.
4. Please note that the reporting is covering enrolled students and not attendance (the actual number of children attending classes). The sector is experiencing a discrepancy between the two, which is being strategically addressed by the Gambella Education Working Group.

HEALTH:

Crude and Under 5 mortality rates have been within the SPHERE standards for several weeks despite being at the peak of malaria season. Good case management by partners of diseases such as severe malaria, dehydration secondary to diarrhoea and complications of severe malnutrition, coupled with strengthened surveillance and prevention efforts have plausibly contributed to the low mortality. The slight rise in the crude and under 5 mortality rate in Nip Nip is attributed to drowning of 2 brothers during the rainy season and the movement of refugees to higher grounds.

Morbidity indicators:

Diarrhoea: Low incidence of diarrhoea might be explained by the ongoing sensitization of the refugees by the Community Outreach Agents (COAs) on hygiene and sanitation. WASH activities are also ongoing in all locations.

Malaria: Incidence rate is high in Pagak entry point compared to other locations and can partly be explained by the delayed distribution of Long Lasting Insecticide nets (LLIN) at this location and as a result transmission rate is still high. At least 18% of the community must use bed nets in order to have a "minimum community level impact" on transmission, we therefore have planned to conduct focus group discussions (FGDs) in Pagak to have a better understanding of LLIN utilization.

Vaccination:

The coverage is more than 100% at the entry points of Pagak, Akobo, Burbiey and overall Gambella coverage for Vit A because the denominator was based only on registered asylum seekers while the numerator included unregistered too. The coverage is lower in the camps because most children had been vaccinated at the entry points and thus not reflected in the camp data. At all entry points, non-selective arrival vaccination service is on-going for all eligible asylum seekers regardless of registration status. At Matar transit center, we have been conducting selective arrival vaccination service for those children who didn’t get vaccination at burbeiy and Akobo entry points and babies who were born at matar transit center.
