

Outbreak Alert and Response

In Week 33, disease outbreak alerts are issued for the following diseases.

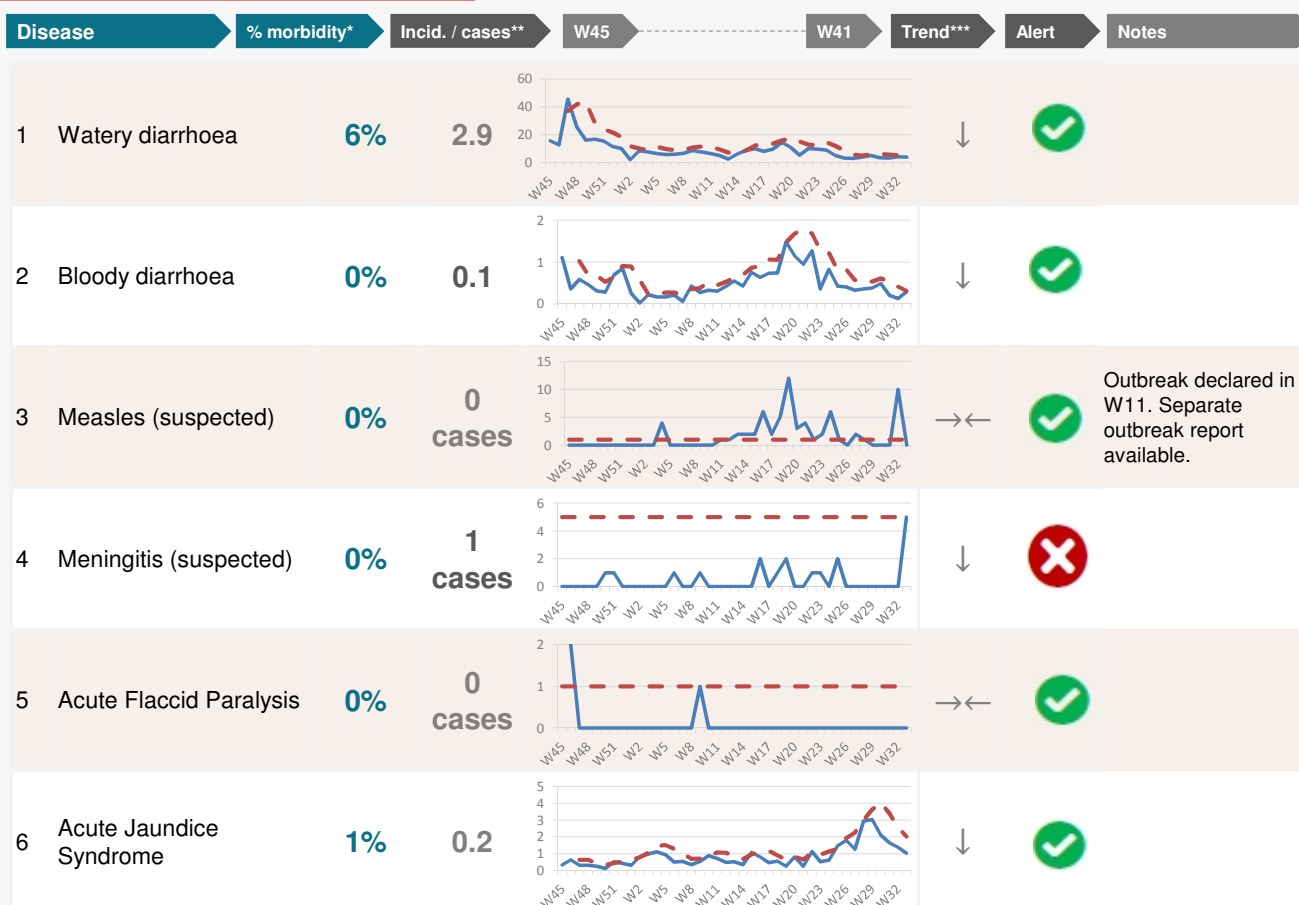

See notes below for calculation of alert thresholds.

Graph legend:

— Incidence / number of cases
- - - Alert threshold

Calculation of disease alert thresholds:

Watery diarrhoea = $1.5 \times \text{baseline}^{\text{y}}$

Bloody diarrhoea = $1.5 \times \text{baseline}^{\text{y}}$

Measles = 1 case

Meningitis = 5 cases

Acute Flaccid Paralysis = 1 case

Acute Jaundice Syndrome = $1.5 \times \text{baseline}^{\text{y}}$

Footnotes

^y *baseline* = average incidence or number of cases over the previous 3 weeks

* % morbidity refers to proportional morbidity of the disease for the current reporting week

** Incid / cases is the incidence (/1000/week) or number of cases for the current reporting week (incidence is shown unless otherwise indicated)

*** Trend shows if the incidence or number of cases between the previous and the current reporting week increased (↑), decreased (↓) or

Other diseases of public health importance
