Background and Methodology

This Protection Monitoring report provides insight into the situation in Yemen, focusing on data collected by UNHCR partners* from 1st January – 30st June 2024. The data collection involved interviewing 47,222 households (HHs), with gender distribution of 71 per cent male and 29 per cent female. Among the assessed households, 84.2 per cent are IDPs, 6.7 per cent are IDPs returnees, and 9.1 per cent belong to host communities. Furthermore, 68.5 per cent of the assessed IDPs are residing in IDP sites. Data collection was carried out in local language (Arabic) by enumerators using the KoBo data collection tool. Of those enumerators 37 per cent were female staff. Quantitative data was complemented with qualitative insights gathered by UNHCR and its partners.

In 2023, UNHCR assessed **136,913 households** (HH) across Yemen consisting of **820,440 individuals**, utilizing protection monitoring tools to engage with IDP communities, identify individuals facing protection and socio-economic challenges, and facilitate their referrals to relevant service providers.
