EXPLANATORY NOTES:

SUMMARY:

This matrix is prepared and published monthly, representing what happened in various sectors in the particular reference month. This indicators matrix is a step towards showing a comprehensive picture of the current situation in Gambella region and establishing a basis for initial trend and gap analysis. In order to better understand the matrix, following are the explanatory notes on some of the sector indicators:

NUTRITION:

- All recovery rates for both SAM (OTP) and MAM (TSFP) are within the SPHERE standards of performance in Kule, Tierkidi and Jewi. In Pugnido refugee camps, a high referral rate was reported. UNHCR is building capacity of partners to improve the quality of care in all camps.

SHELTER:

- Over all, the Camps partners continued finalizing the transitional shelters construction. The % of households in emergency family shelter indicates the need for continuous shelter intervention in all the camps.

- 'Transitional shelters' refers to those that have been completed with mud plastering. However, some of the semi-permanent structures in the matrix have not been yet mud plastered.

- Pugnido 2 mapping exercise and development of the master plan has been completed.

- Entry points and transit centers are all with communal hangers and therefore not included in the matrix. The indicators are based on the total number of registered households.

WATER, SANITATION AND HYGIENE (WASH):

The WASH indicators have been generally maintained and slightly improved in the period from primo July to primo August:

1. Significant improvement is observed in all refugees camps especially in kule and Tierkidi

increasing the latrines coverage

2. Water coverage was maintained above sphere standards in all camps except Jewi refugee

camp

Important note:

- The indicators for the camps are broadly administrative indicators i.e. the indicators are currently relying on total camp population (entire protected refugee population) as the denominator however due low profile observed at the entry points/transit centers, indicators were not provided.

EDUCATION:

- The enrollment data remains unchanged and is same as of June however population data has been changed as of the current reporting month.

- Gross Enrollment Rate (GER) for school going age (3 - 18 years) has increased from 43% to 45% in the period from primo June to primo July. This increase is primarily because of the increase in enrollment rate in Jewi refugee camp from 21% to 48%.

- GER for pre-primary education ages (3 - 6 years) had increased from 26% reported previous month to 39% this month. This increase is attributed to the partners who are continuously creating awareness for the importance of early childhood care and education to community. This increase is also because of increase in enrolment rate of Jewi camp from 10% to 69%.

- GER for Primary education age group (7 -14 years) showed a 2% increase and is currently at 66%. Enrolled students are likely to be above the target age bracket and the data may be misleading.

- Secondary education enrolment is in Pugnido and Okugo camps. In Pugnido, GER is 12% while in Okugo, GER stands at 9%.

- Accelerated Learning Programme (ALP) is not captured in this matrix. Efforts by the sector are being done to capture students individual registration number to avoid double counting since these group falls under the same age bracket as primary school (7 - 14 years).

- Student attendance is not the focus of this matrix report. The education working group is working on improving school attendance which is way below if compared to those enrolled.

HEALTH:

Mortality: Crude and Under 5 mortality rates have been within the SPHERE standards for several weeks. Good case management by partners of diseases such as severe malaria, dehydration secondary to diarrhoea and complications of severe malnutrition, coupled with strengthened surveillance and prevention efforts have plausibly contributed to the low mortality. It is imperative to improve with Reproductive health and HIV services.

Morbidity indicators:

Diarrhoea: is showing high incidence, it is imperative for Wash to increase the water quantity in some of the camps e.g. Jewi, as well as the sanitation and other services. Enough resources were directed to refugee locations to ensure that diseases are prevented, for instance no High Mortality rates were shown due to malaria with People of concern.

Malaria: Incidence rate is high in all camps, higher in PAGAK compared to other locations and can partly be explained by the small transit population. The rainy season has a big impact with the increase number of malaria cases, the mobilization of ITNF's in all camps took place since the month of June.

Vaccination:

The coverage is between 92% and 100% at the entry points of Pagak, Akobo and Burbiey for selective and non-selective vaccination. The coverage is lower in the camps because most children had been vaccinated at the entry points and thus not reflected in the camp data. At all entry points, non-selective arrival vaccination service is on-going for all eligible refugees regardless of registration status. At Matar transit center, selective arrival vaccination service is being conducted for those children who didn't get vaccination at Burbiey and Akobo entry points and for babies who were born at Matar transit center.
