

Ministry of Education

# Jordan Nationwide Assessment in Public Schools for Strategic Planning

2015-2016

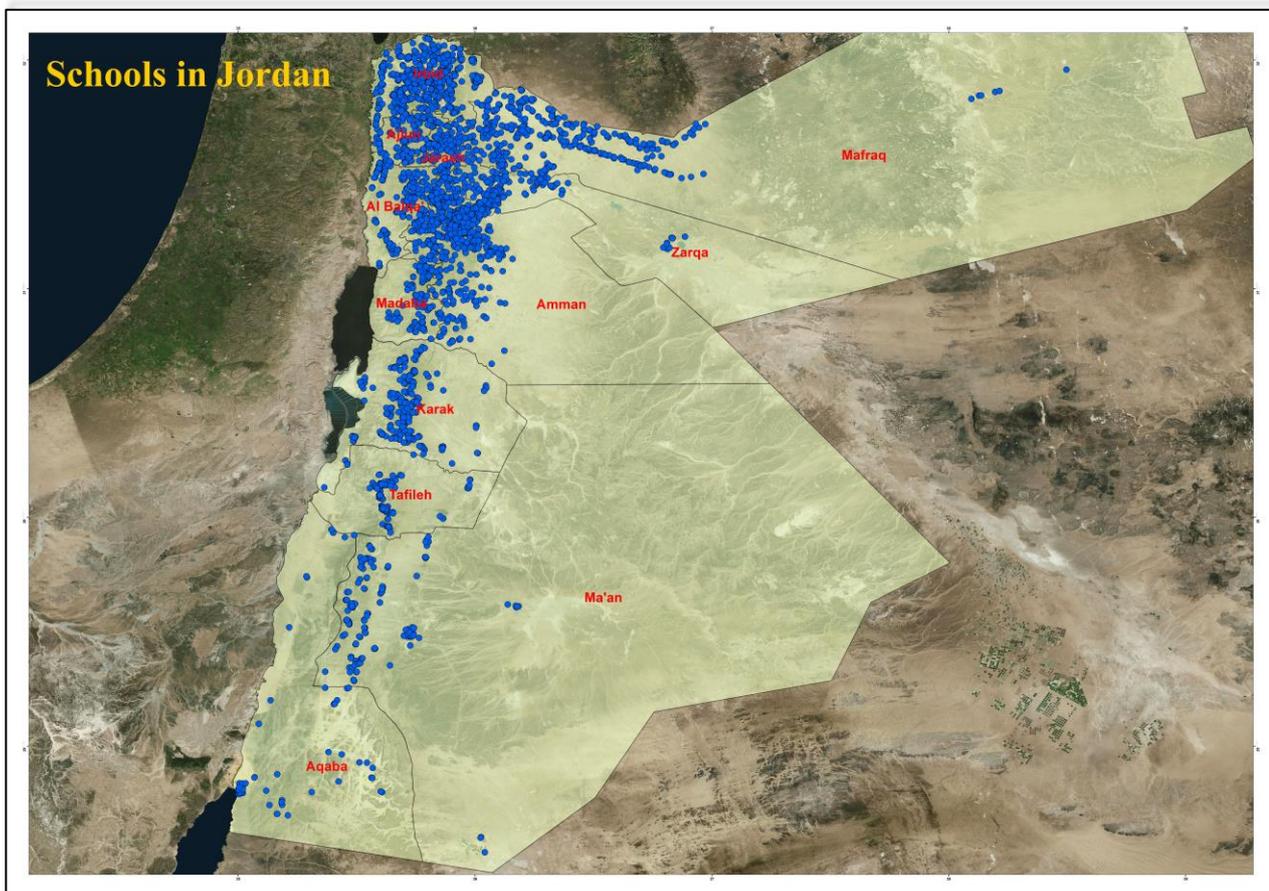

## I. ACKNOWLEDGEMENT

Jordan, with a population of just over 6 million, has absorbed more than half a million Syrian refugees since 2011. Syrian children as well as Jordanian children are attending schools overstrained by the influx of Syrian students. According to the Ministry of Education more than 56 per cent of Syrian children, were not receiving formal schooling in 2015. In urban communities across Jordan, the Ministry of Education is still looking for a way to include more Syrian children. Overcrowding of the educational system has tremendous impact both on the infrastructure and the children and represents a major challenge for the Ministry of Education. Every year more and more children need to be accommodated in the already overcrowded conditions.

The nationwide mapping and assessment of public schools in Jordan was initiated and completed by the Ministry of Education (MoE), JEN and UNICEF. The objective of the assessment and mapping was to identify system-wide strengths, weaknesses and gaps in relation to international standards regarding the school structures, with the aim of guiding strategic actions to ensure favorable learning environment for children.

The results of this assessment take into account only the situation in 2015 and are based on internationally recognized standards for education in emergency and post-conflict situations. Absorption of children left out of the educational system and the increasing number of both Jordanian and Syrian children were not taken into consideration.

Some of the key findings include: structural gaps in school conditions regarding classroom space, water and sanitation, and accessibility; as well as soft components comprising child protection, social mobilization and capacity building.

NGO:	Non-Governmental Organization
PTA:	Parent Teacher Association
WASH:	Water, Sanitation and Hygiene
WatSan:	Water and Sanitation

## II. ASSESSMENT MODALITY

### Target

This assessment targeted all public schools throughout Jordan. It covered all 89 districts in all 12 governorates. The list of schools in Jordan was provided by the MoE in collaboration with UNICEF. The original list contained 3,630 basic (Primary) and intermediate (Secondary) schools. During the field visits, the list was corrected and updated by the assessment process as some schools were closed, merged with others or newly established in 2015. As a result, the number of assessed schools reached 3,681 schools.

### Assessment Methodology

The assessment was conducted from 11 December 2014 to 30 April 2015. Data was collected through surveyors' field inspection as well as in-person interview to school principals, based on the questionnaires. In order to ensure the quality of data collected, random verification visits were conducted in 5% of the schools in each governorate.

The database was designed and developed by School National ID which is unique to each school in Jordan. Microsoft Access was used to build the database and ArcGIS for mapping.

### Main Topics Assessed

Assessment questionnaire form covers the following 7 categories:

1. **General Information:** Information about locations, gender, building ownership, number of students, classrooms and educational levels.
2. **Students:** Transportation information, school distance, support of children with special needs.
3. **Teachers:** information related to teachers training as subjects and provider, sharing the knowledge with other schools and teachers
4. **Parents and the Community:** Information of PTA, community contributions to schools
5. **Water, Sanitation and Hygiene:** General information related to water, wastewater, latrine facilities, numbers and condition of the water and sanitation (WatSan) facilities and hygiene promotion in schools
6. **School Facilities:** Information on the age of the school building, availability of space for construction/expansion and security measures such as walls and guards.
7. **Child Protection:** Schools' awareness of child protection, psychological and social support

Each category was assessed through a specific set of questions.

**Table 1 Number of districts and schools by governorate**

		<b>25</b>	<b>680</b>
<b>Total</b>		<b>89</b>	<b>3,681</b>

### III. GENERAL INFORMATION AND DATA COLLECTED

#### 1. Schools

The number of public schools in Jordan has gradually increased (Figure 1)<sup>1</sup>. There were 3,694 schools in 2013/2014. The number of schools JEN assessed reached 3,681 schools, which is slightly lowered than that in 2013/2014 due to the elimination and merger of schools. Schools concentrate in Amman, 783 schools, 21% of total, in Irbid, 689 schools, 19% and in Mafraq, 480 schools, 13% (Figure 2).

In Jordan, public schools are culturally segregated by gender above third grade, which is also culturally supported and accepted by local communities. The number of girls' schools is less than half of boys' schools even though the population of girl students is slightly larger than that of boys as shown in the next section (Figure 3).

Figure 1 Number of schools for the past 10 years

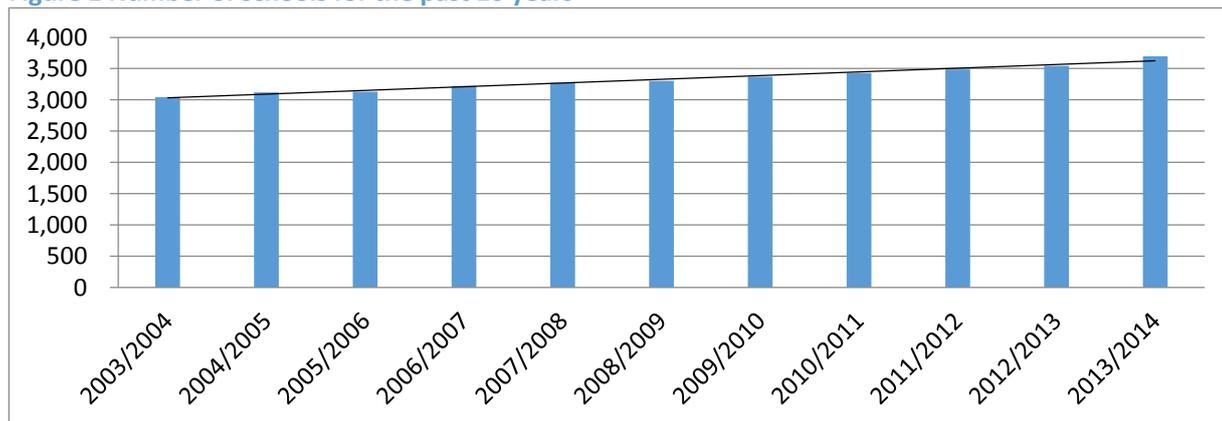

Figure 2 Number of assessed schools by governorate

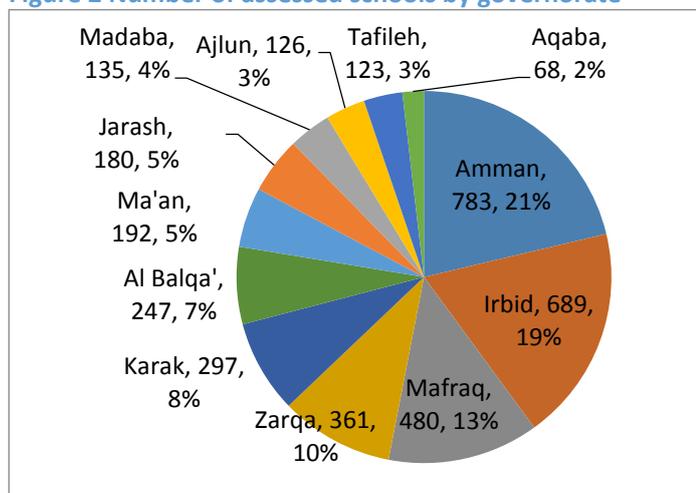

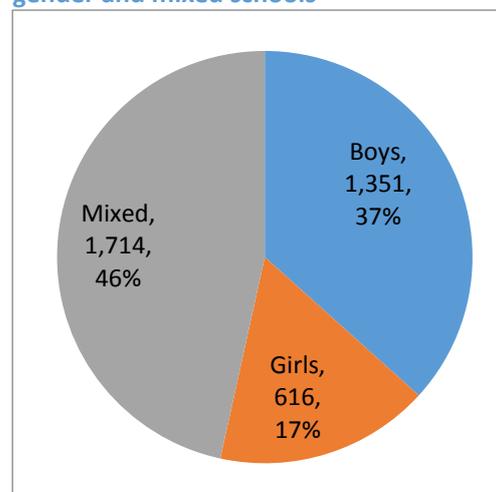

Figure 3 Number of assessed schools: Single gender and mixed schools

<sup>1</sup> MOE, Annual report

In Jordan, there are three types of school building ownership; one is MoE-owned schools whose buildings belong to MoE and buildings are built for an education purpose, the second one is rented schools which MoE rents commercial or residential buildings to use as schools. Owing to that, rented schools have several inadequate features as a school, such as different sizes of classrooms, inappropriate design of classrooms for learning, limited outside space for children, insufficient outdoor latrine facilities. The third type is MoE-owned but part of the school facilities are rented.

The number of rented schools has increased since 2011 as Figure 4 shows<sup>2</sup>, and this assessment found that 21% of the schools are rented or partially rented (Figure 5). The proportion of rented schools is highest<sup>4</sup> in Amman, Irbid and Mafraq where students are concentrated (Figure 6)

Figure 4 Number of rented schools 2011-2014

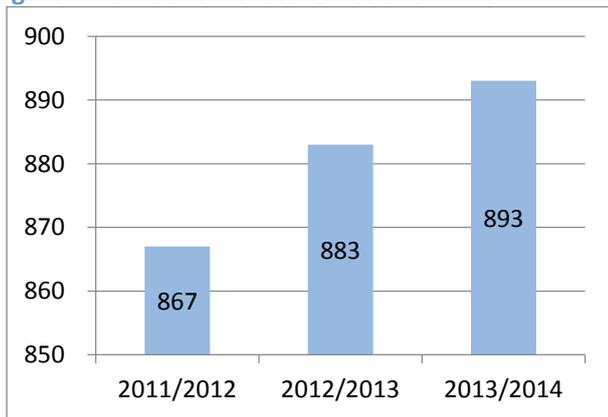

Figure 5 Number of assessed schools: School building ownership

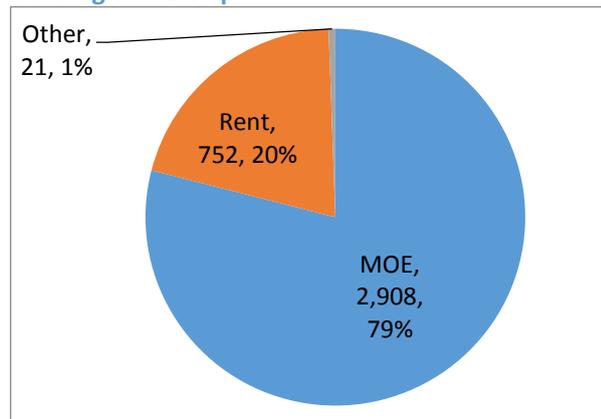

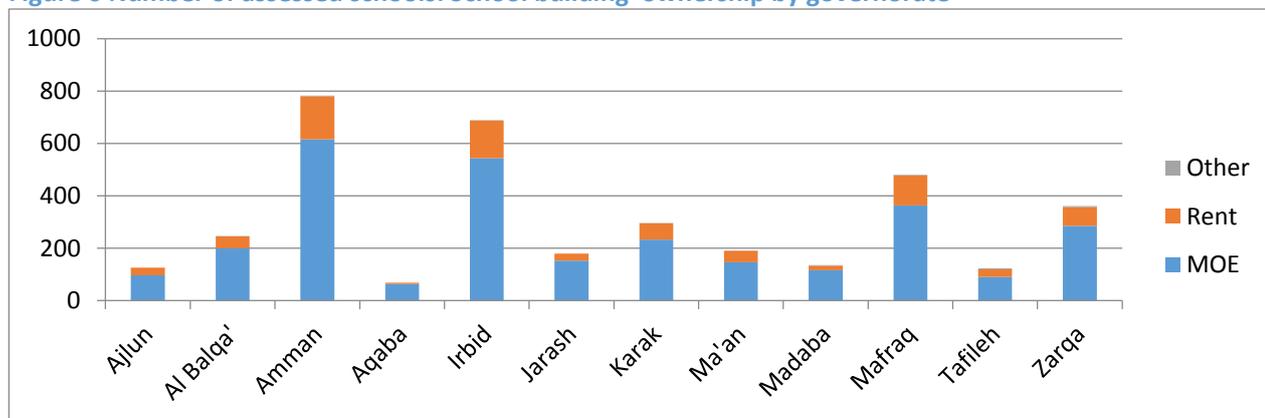

Figure 6 Number of assessed schools: School building ownership by governorate

The educational system in Jordan covers from Kindergarten to twelfth grade including basic and secondary schools. The basic school consists of grades 1-10 (6-16 years old). Basic schooling is free and compulsory for all Jordanian students. Secondary education (grades 11-12) comprises two major streams: comprehensive secondary (academic and vocational) and applied secondary. Secondary education is free but not compulsory. Basic schools account for 65% and secondary schools for 35% of total schools assessed (Figure 7). In Ma'an, Tafileh and Zarqa, secondary schools are less than 30% of the total number of schools. The advancement rate in secondary schools in those governorates might be affected.

<sup>2</sup> MOE, Annual report

Figure 7 Number of assessed schools: Educational levels

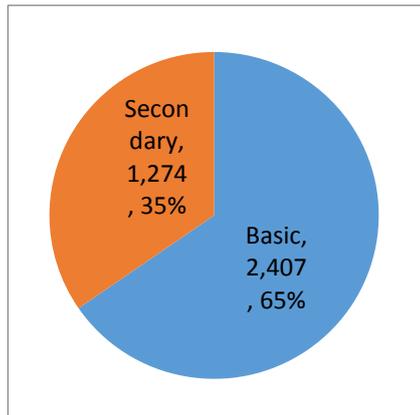

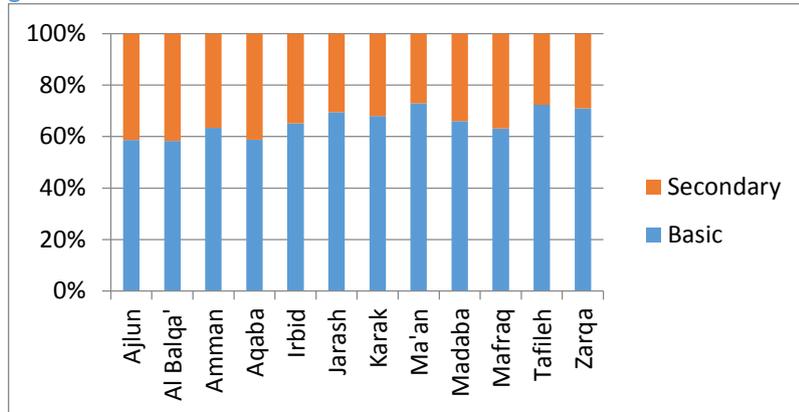

Figure 8 Percentage of assessed schools: Educational levels by governorate

The assessed schools were also categorized into three types of geographical classification: rural, semi-urban and urban. Rural areas are defined as an area where it is surrounded by rural or agricultural land with limited public facilities. Semi-urban areas are where all kinds of public facilities are available but smaller in size. Urban areas have high population densities and a full set of public facilities. The assessment found that schools are proportionately distributed, 34% in rural, 32% in semi-urban and 34% in urban areas (Figure 9).

As (Figure 10) shows, the proportion of mixed schools is higher in rural areas. One of the reasons might be that it is not financially feasible to have single-gender schools due to a small number of students in the areas. Given the small difference in the number of boys' schools among geographical classification, however, boys seem to be prioritized to have single-gender schools.

Figure 9 Number of assessed schools by geographical classification

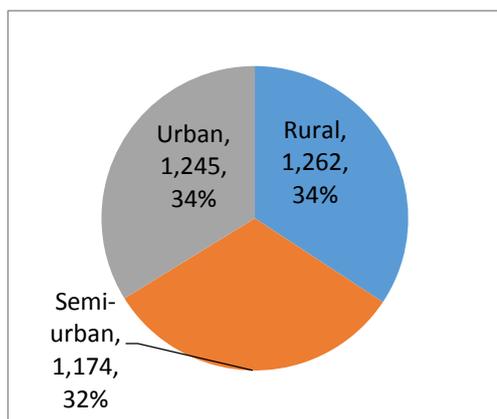

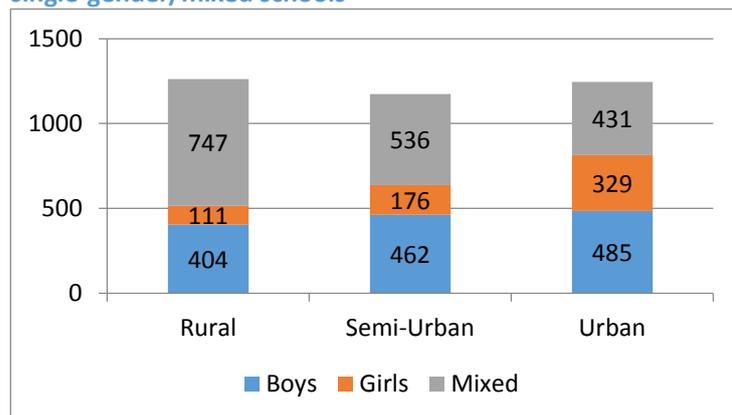

Figure 10 - Number of schools: Geographical classification and single-gender/mixed schools

One response to absorbing of a growing number of students, MoE has placed schools on double shifts. The number of double-shift schools has risen since 2011, as (Figure 11) shows<sup>3</sup>. This assessment recorded 356 double-shift schools, which is approximately 100 schools less than the number on the MoE data for 2013/2014. This might be caused by a time gap or insufficient data. Double-shift schools are concentrated in governorates which have a large number of students such as Amman, Irbid, and Zarqa.

<sup>3</sup> MOE Annual Report

Figure 11 Number of double-shift schools: 2011-2014

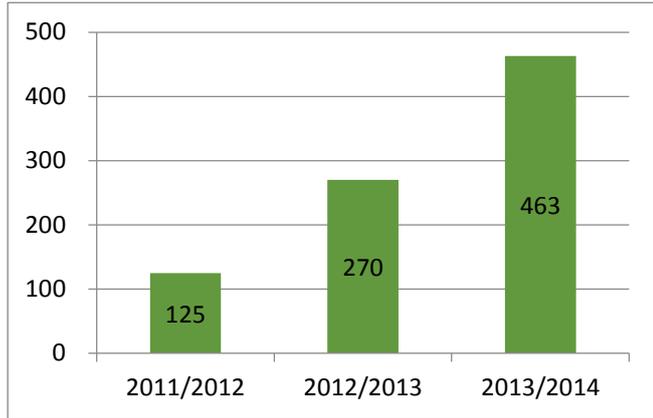

Figure 12 Number of assessed schools: School shifts

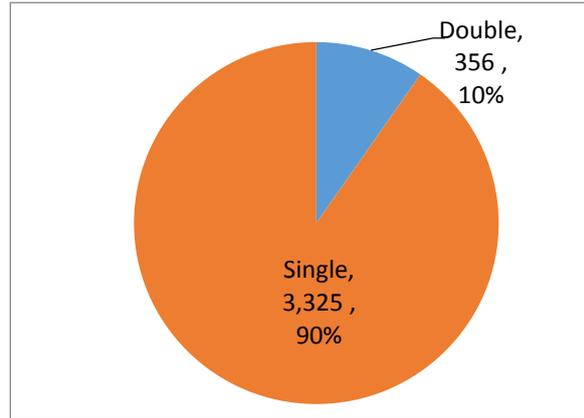

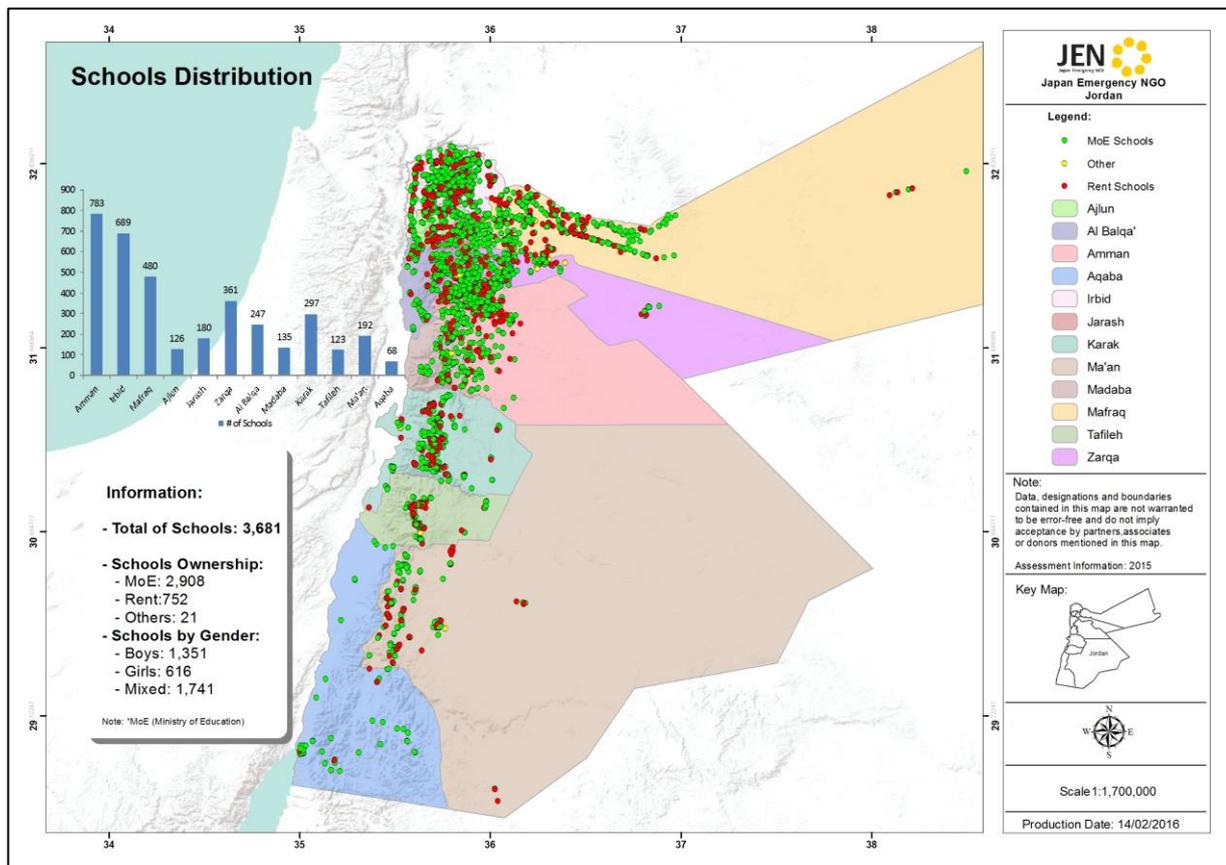

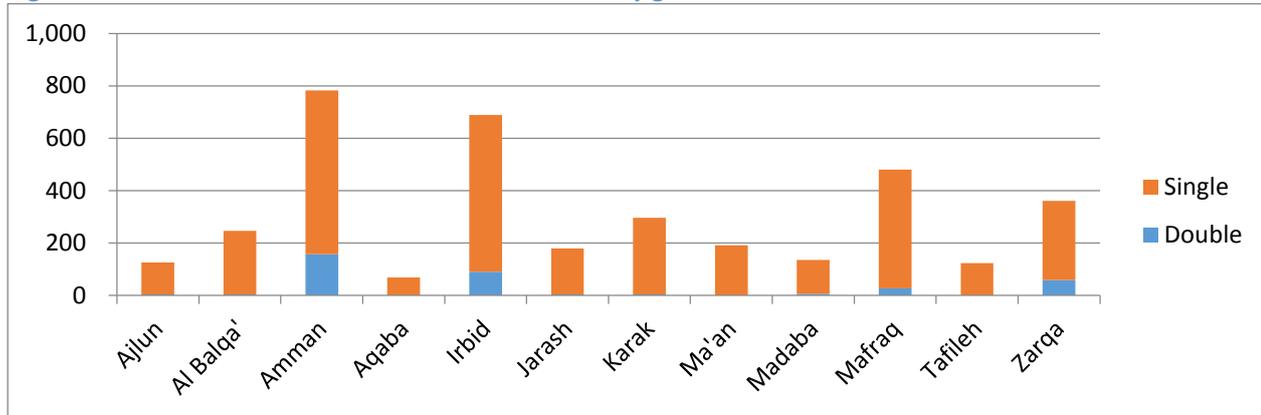

Figure 13 Number of assessed schools: School shifts by governorate

Map 1 Schools Distribution in Jordan

## 2. Students

As (Figure 14) shows, over the past 10 years; Jordan has experienced an average student growth rate of 1.81%, 1.43% for male students and 2.15% for female students<sup>4</sup>. In respect of gender balance, the share of female students is higher than that of male students. In this assessment (Figure 15), the total number of students in 3,681 schools reached 1,274,998 students. The trend for the past 10 years indicates a slightly higher number of girls than boys.

(Figure 16) presents school enrollment rates in each level of education. Single-gender schools were available for 78% of boy students, while for only 45% of girl students. In both basic and secondary schools, the percentage of female students who could attend single-gender schools is significantly less than that of male students.

Figure 14 Number of students for the past 10 years

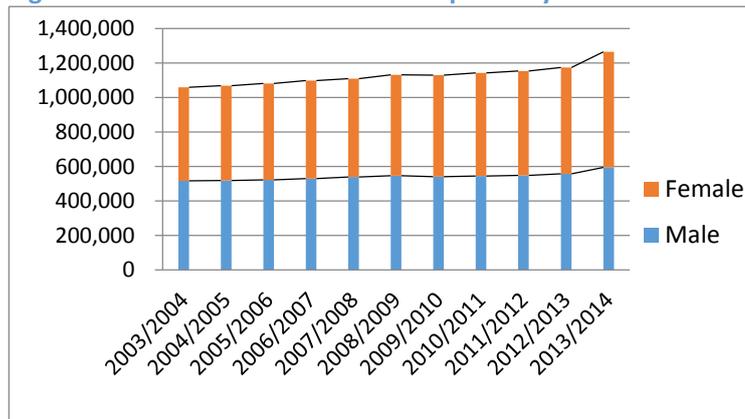

Figure 15 Number of students: Gender

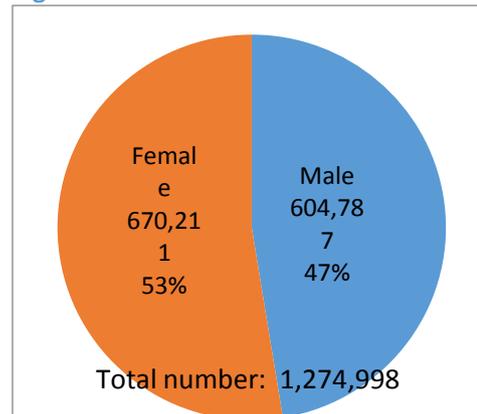

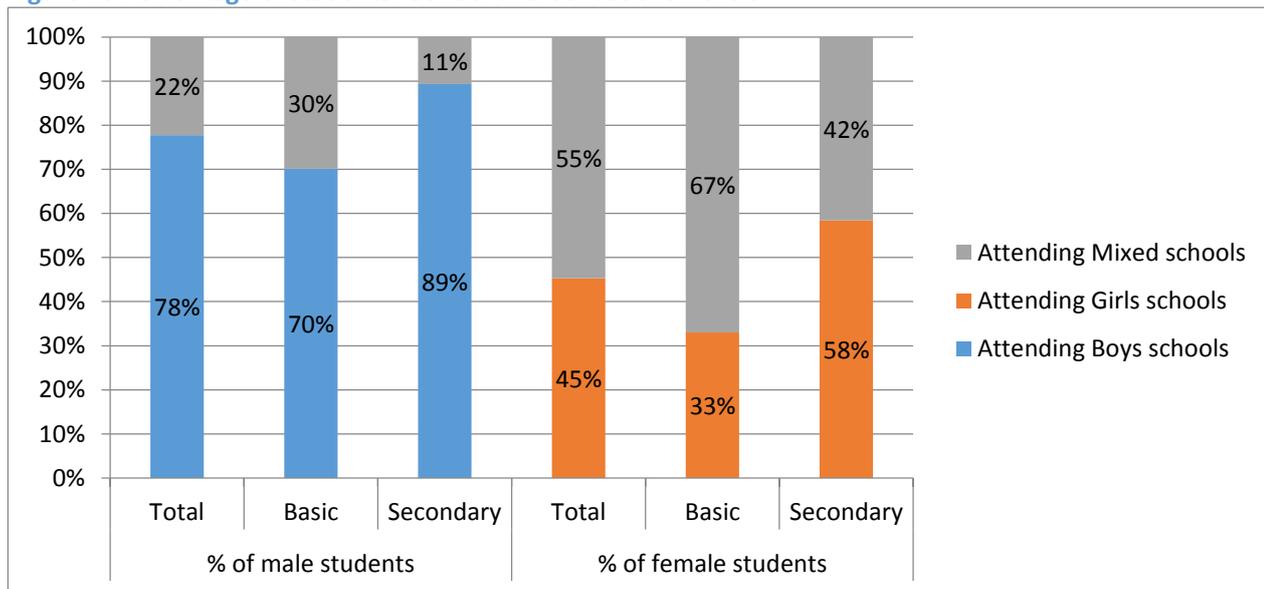

Table 2 Number of students in single-gender/mixed schools by educational level

Number of Boys Students in			% of students
Boys schools	Basic	258,312	
	Secondary	211,671	
Mixed schools	Basic	109,403	22%
	Secondary	25,401	
<b>Total</b>		<b>604,787</b>	
Number of Girls Students in			% of students
Girls schools	Basic	114,545	
	Secondary	189,028	
Mixed schools	Basic	232,013	55%
	Secondary	134,625	
<b>Total</b>		<b>670,211</b>	

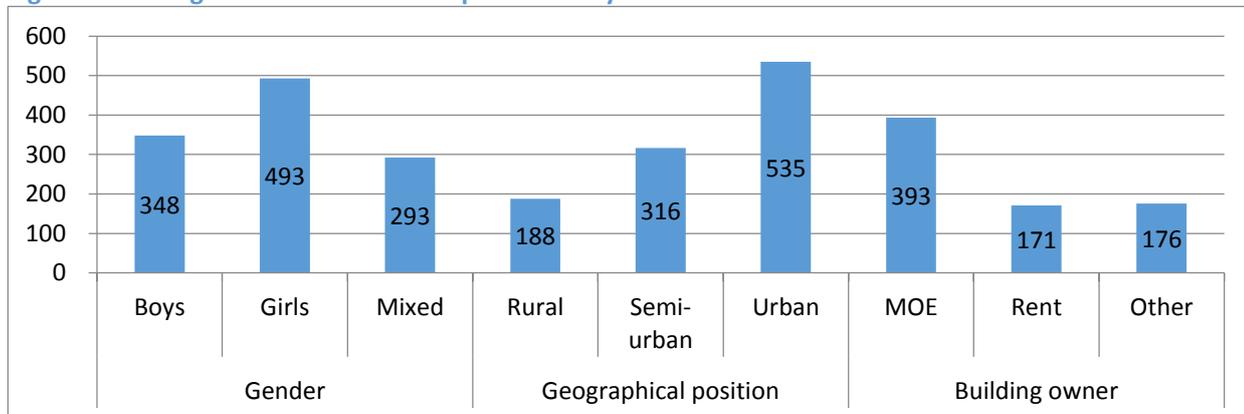

<sup>4</sup> MOE, Annual report

Figure 16 Percentage of students: Gender and educational levels

The average number of students per school showed clear differences by three characteristic features (Figure 17). According to population density, the average school size was bigger in urban areas. Rented schools were smaller on the scale of student population than MoE-owned schools due to space restrictions. Noticeably, the average number of students per girls’ school is 1.5 times that per boys’ school, which reflects the fact that there are more boys’ schools than girls’ schools.

Figure 17 Average number of students per school by characteristic features

As (Figure 18) indicates, Syrian students accounted for 7% of the total number enrolled in public schools in Jordan. According to the UNHCR statistics on 14 March 2015<sup>5</sup> at the time of assessment was conducted, the number of Syrian children of school age (5-17 year old) was 217,820. The assessment found that 41% of the Syrian children attended Jordanian public schools. The rest were considered to be out-of-school children or were children attending schools inside the camps or in private schools. The male-female ratio of Syrian children enrolled in public school in Jordan was 51% (boys) and 49% (girls) which is proportional to the gender ratio of all school-aged, Syrian children in Jordan, 51.5% for boys and 48.5% for girls. Syrian students were concentrated in urban or semi-urban areas (Figure 19). The highest proportion of Syrian refugee students was hosted by Irbid (32%), Amman (31%), Mafrqa (13%), and Zarqa (11%). The rest of governorates hosted 13% of enrolled Syrian students, which corresponds with the distribution of the total number Syrian refugee students by governorate (Figure 20).

Map 2 Students distribution by governorate

### 3. School Facilities

#### Classrooms

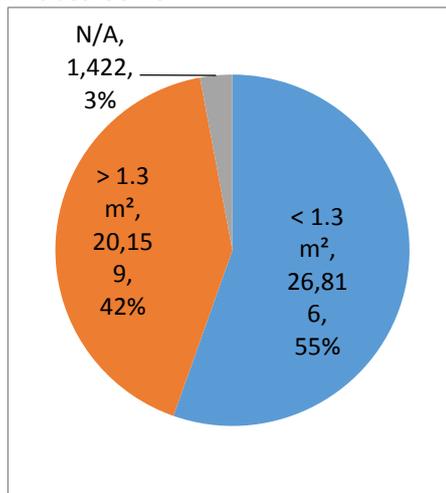

Lack of learning spaces should be specifically emphasized in Jordan especially since the Syria crisis. It affects the quality of education and in the worst case it leads to inaccessibility to school for children. Several cases were reported that some schools denied enrollment to Syrian children, placed Syrians on a waiting list for a long time or transferred Syrians to schools faraway. Not even all Jordanian children are able to enroll in public schools. All these cases result from inadequacy of learning space to absorb an increasing number of students. The results of this assessment give a brief insight into the current situation of overcrowding in public schools.

MoE defines 1.3 m<sup>2</sup> per child as a requirement for learning space in classrooms of MoE-owned schools. USAID Jordan has built classrooms, targeting 1.4 m<sup>2</sup> per child. Less than 0.8 m<sup>2</sup> is considered to be severely crowded<sup>6</sup>. Compared with the requirements in Iraq and Japan as shown in the table below, it is assumed that the Jordanian standard is within the acceptable range at the international level.

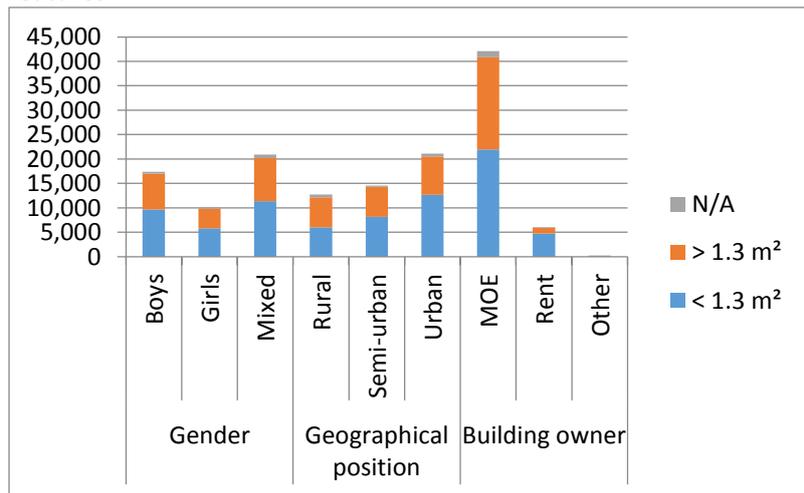

Basic Education	Jordan	Iraq <sup>7</sup>	Japan <sup>8</sup>
Maximum # of students per class	36	40	27
Space per student (m <sup>2</sup> )	1.3	1.1 - 1.7	1.65

Only 42% of the classrooms met the standard while 55% of the total number of classrooms had less than 1.3 m<sup>2</sup> per child (Figure 21). This indicates that 861,575 students have been forced to learn in overcrowded classrooms. Overcrowding in classrooms is prominent in schools in urban areas as well as in rented schools (Figure 22). The overcrowding problem is not critical in schools in rural areas in comparison with schools in semi-urban and urban areas. Schools are scattered in rural areas. If the nearest school denies enrollment to a child, usually the child would not go to any school rather than go to an assigned school far from home. Children in rural areas are culturally affected more than those in other areas from the effects of the shortage of classroom space.

**Figure 21 Space requirements per child in classrooms**

**Figure 22 Classrooms space requirements per child by characteristic features**

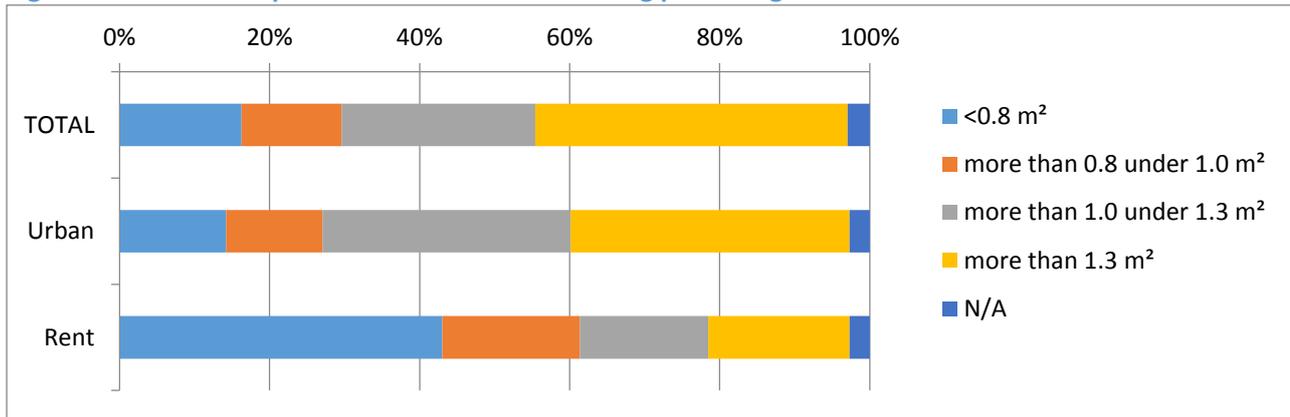

<sup>6</sup> CHECK NCHRD

<sup>7</sup> Ministry of Education in Iraq (2006), Criteria and Standard for Child Friendly Schools

<sup>8</sup> OECD

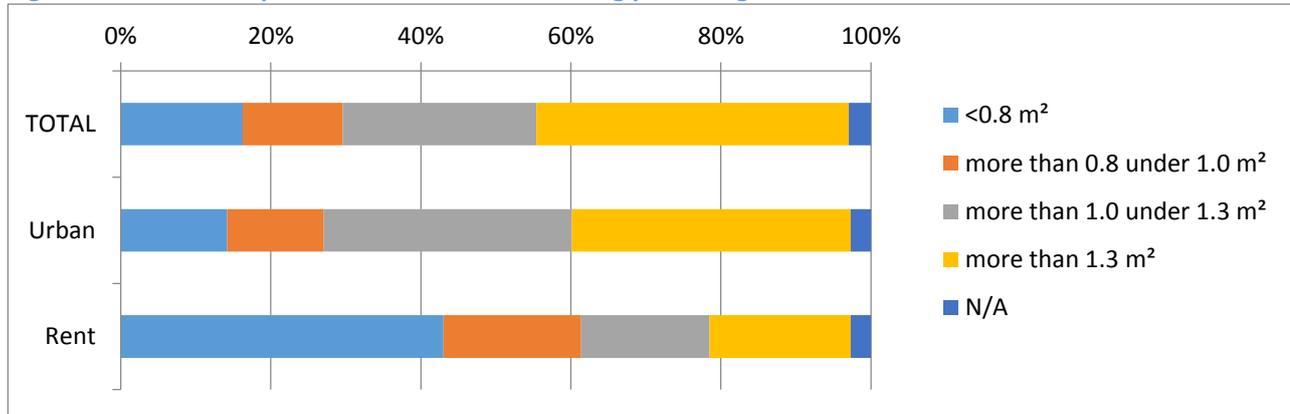

Figure 23 Classroom space and level of overcrowding percentage

As shown, schools in urban areas had a high proportion (33%) of classrooms with space greater than 1.0 but less than 1.3 m<sup>2</sup>. Concerning severely crowded classrooms with space less than 1.0 m<sup>2</sup>, there is little distinction in schools according to geographical areas. This indicates that schools in urban areas are crowded. However, there is still enough space to accommodate additional children if a standard as low as 1.0 m<sup>2</sup> per child is accepted. Relatively crowded classrooms in schools in urban areas, however, are rather difficult to solve in practice. Classroom education is divided by grade level and therefore, the number of students and their grade levels should be considered when classrooms are required to accept the students.

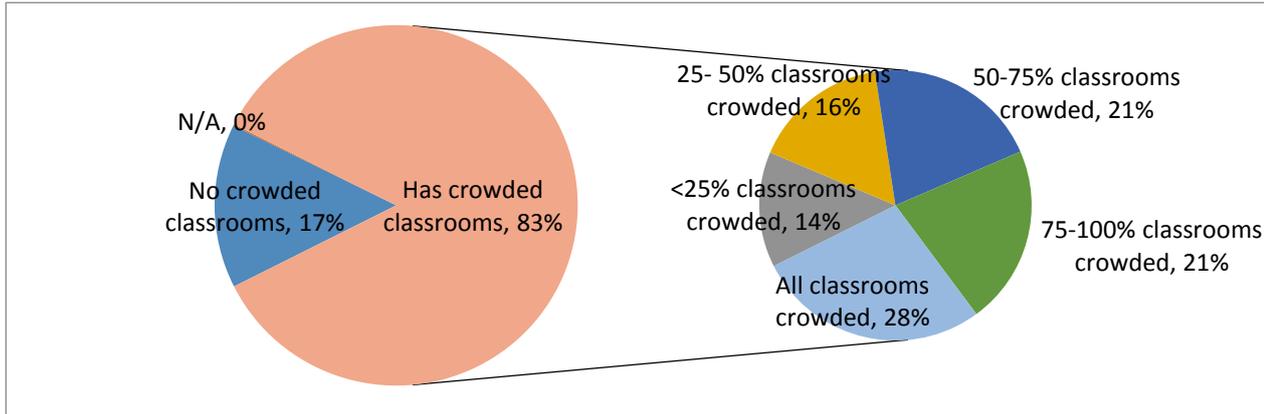

In rented schools, the situation is different and this space requirement is not necessarily applied. Classrooms with under 0.8 m<sup>2</sup>/ child accounted for 43% of the classrooms.

Figure 23 Classroom space and level of overcrowding percentage

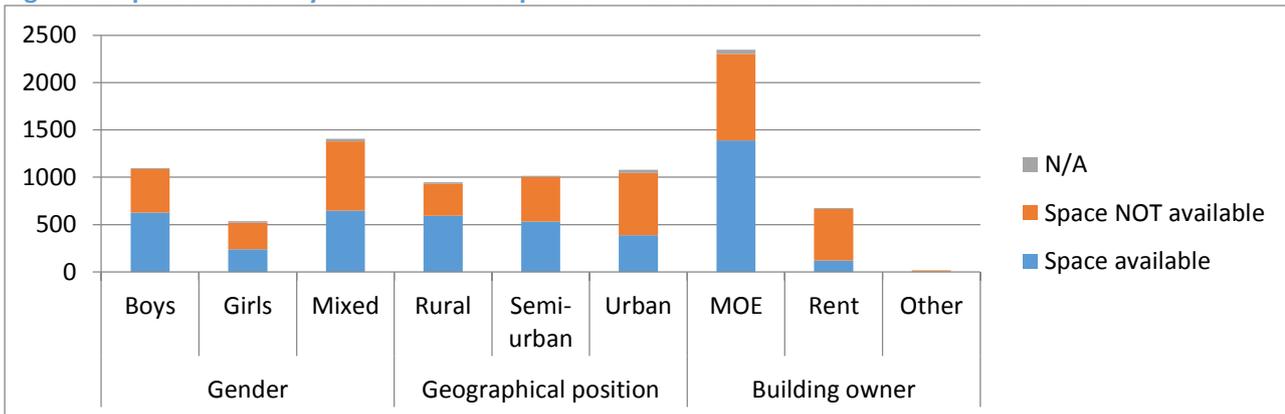

83% of the schools had at least one overcrowded classroom. The degree of overcrowding in classrooms was different between the schools (Figure 24). This indicates that an individual development plan is required based on the extent of overcrowding. From that perspective, schools with fewer overcrowded classrooms might be able to reallocate classrooms depending on the student enrollment by grade; grades with larger enrollment would use the larger size classrooms in the school. Solutions for schools with many overcrowded classrooms may include construction of larger-scale classrooms. Construction of a new school could also be considered. However, it is difficult to construct an additional building or classrooms in rented schools as the owner of the school buildings do not belong to the MoE.

Figure 24 Percentage of overcrowded classrooms

Regardless of the degree of overcrowding, the key element of a strategic plan is the availability of empty space in schools. In this assessment, space availability was observed for at least one classroom. Out of 3,039 schools, only 50% has enough available space for students. It is remarkable especially in schools in urban areas, 45.9%, where reducing overcrowding is crucial.

Figure 25 Space availability for classroom expansion in schools with overcrowded classrooms

The following presents estimated costs of additional classrooms in schools where space is available. In this assessment schools were considered to have available space if they had space to construct at least one classroom. However, not all schools requiring more than one classroom will have sufficient space for the full number of required classrooms. Therefore, further survey effort may be required for actual planning.

Cost estimation 1: Classroom expansion

Priority	Criteria	Targeting Schools	# of required classrooms	Total Cost JD
FIRST priority	- MoE- owned schools - Overcrowded classrooms - Space available for a new classroom	1,390	2,834	70,850,000
TOTAL		1,390	2,834	70,850,000

Conditions of estimation:

- ✓ Classroom size: 48 m<sup>2</sup> (8m x 6m) for 36 students
- ✓ Corridor and stair inclusive, classroom furniture exclusive
- ✓ Average costs per classroom: JD25,000
- ✓ # of required classrooms is calculated by:
  - Additional classroom space required: 132,607 m<sup>2</sup> =(Actual # of students per classroom x 1.3 m<sup>2</sup> - actual classroom size)

Required # of classrooms:  $132,607 \text{ m}^2 / 46.8 \text{ m}^2$  (1.3  $\text{m}^2$  x 36 students)

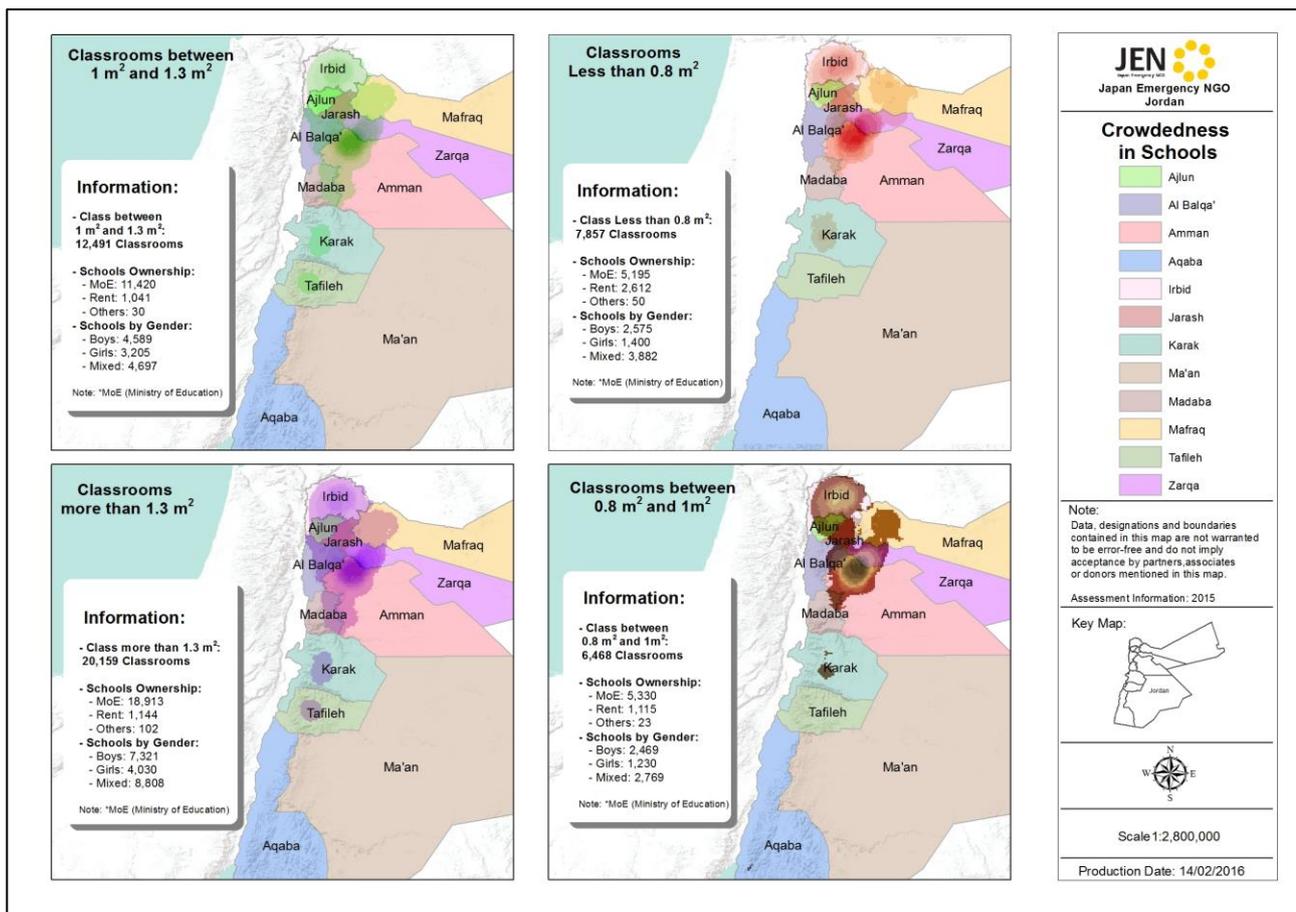

The following shows estimated costs of building new schools to accommodate the overflow of students in schools with no space for building even one classroom.

**Cost estimation 2: New school construction**

Priority	Criteria	# of required new schools	Total Cost JD
FIRST priority	- MoE-owned schools - Overcrowded classrooms - No space available for building a new classroom	179	253,464,000
TOTAL		179	253,464,000

**Conditions of estimation:**

- ✓ # of classrooms per school: 12-15 classrooms
- ✓ # of students per school: 500 students
- ✓ Average costs per school: JD1,416,000
- ✓ # of schools is calculated by:
  - Additional space required to accommodate actual number of students:  $116,059 \text{ m}^2$  =(Actual # of students per classroom x 1.3  $\text{m}^2$  - actual classroom size)
  - Required # of schools:  $179$  =(116,059  $\text{m}^2 / 1.3 \text{ m}^2 / 500$  students per school)

Map 3 Crowdedness in Classrooms

### Safe School Environment

School premises should be protected in order to avoid break-ins or vandalism of school facilities by outsiders and to ensure a safe learning environment for children. Unsafe and insecure learning environments would affect school attendance especially for girls and younger children.

In Jordanian schools walls, fences and guards are common safety measures taken to create a safe school environment. As (Figure 26) shows, 59% of the schools have both a guard and a wall/fence, 28% had only a wall/fence only, 5% had a only a guard, and 8% had neither a guard nor a wall/fence. Compared with boys' and mixed schools, girls' schools have taken more security measures. However, due to lack of security measures in mixed schools there is no significant difference in the number of students exposed to the security risk by gender (Figure 28).

19,920 boy students and 17,314 girl students were studying in the 8% (303) of schools without any wall/fence or guard provided. Schools in urban areas were generally better protected by security measures, than schools in rural areas. It is assumed that rural areas are considerably safer than urban areas. Rented schools also tend to have fewer security measures as well. Among the schools with guards, 96% of the schools have a guard during the night and 18% also have a guard during the day (Figure 29). Even in schools without a wall but with a guard, the working time of a guard is mostly during the night. The presence of a guard at night enhances security.

Figure 26 Number of assessed schools: Security measures

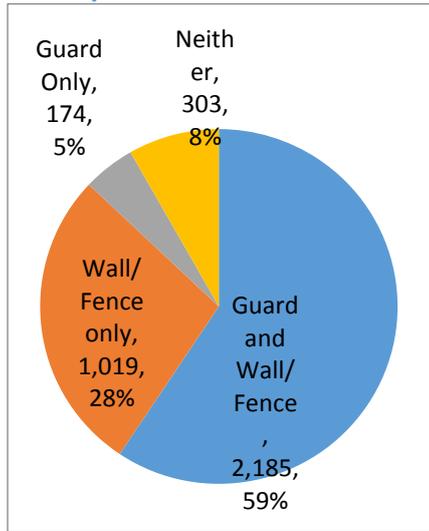

Figure 27 Number of assessed schools: Security measures by characteristic features

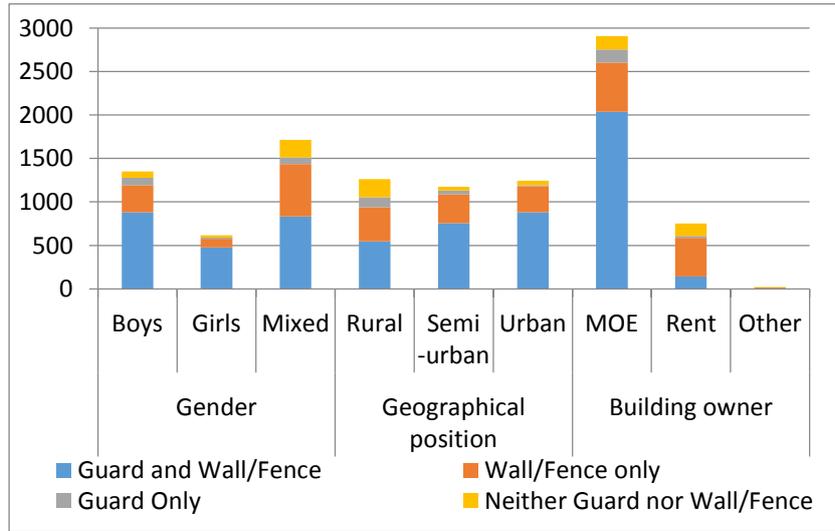

Figure 28 Number of students: Security measures and protection of students by gender

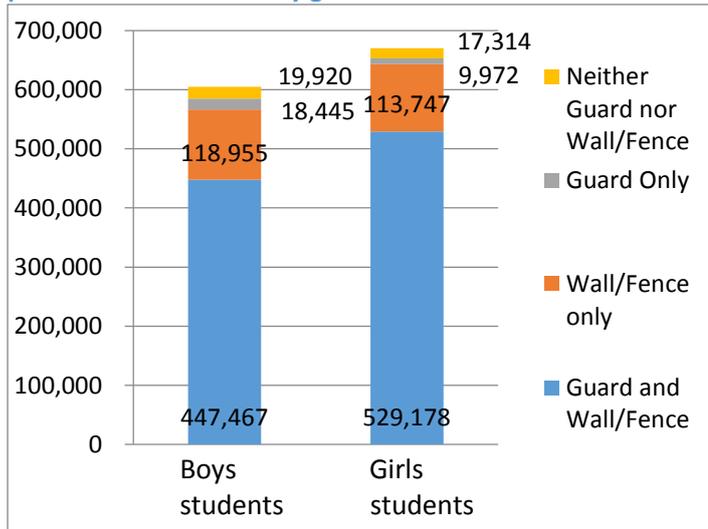

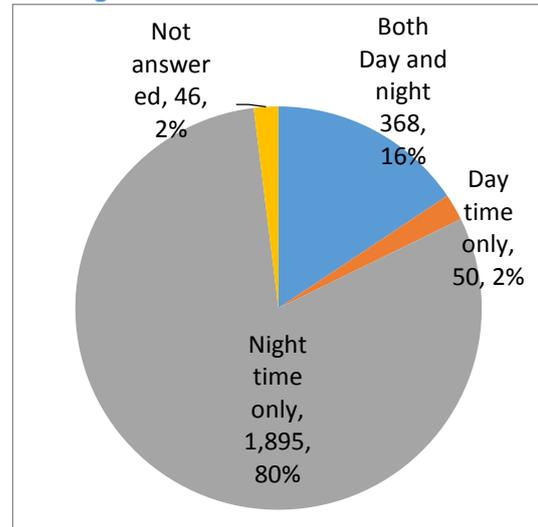

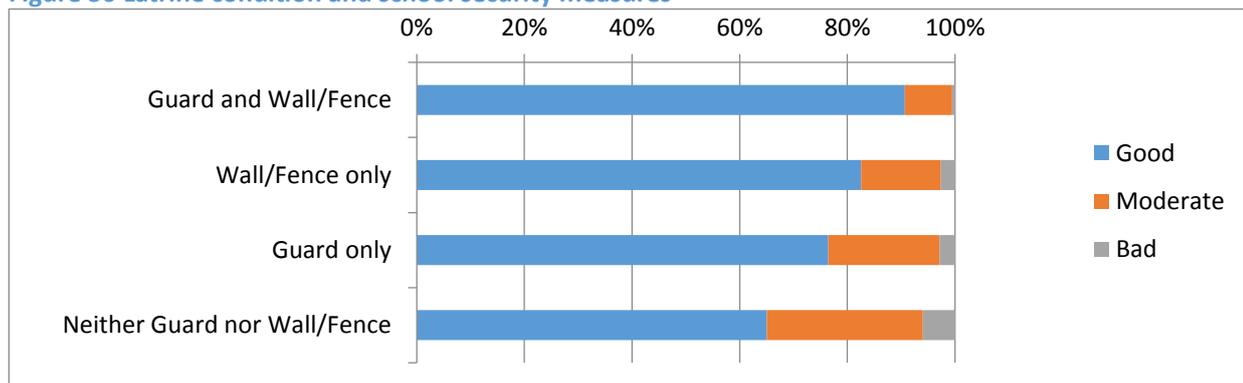

Figure 29 Number of assessed schools: Guard working time

The availability of security measures might be linked to the conditions of school facilities. When correlating school latrine conditions and security measure, fewer schools without a guard and a fence maintain latrines in good condition. Enhancing school security could also contribute to the maintenance of school facilities.

Figure 30 Latrine condition and school security measures

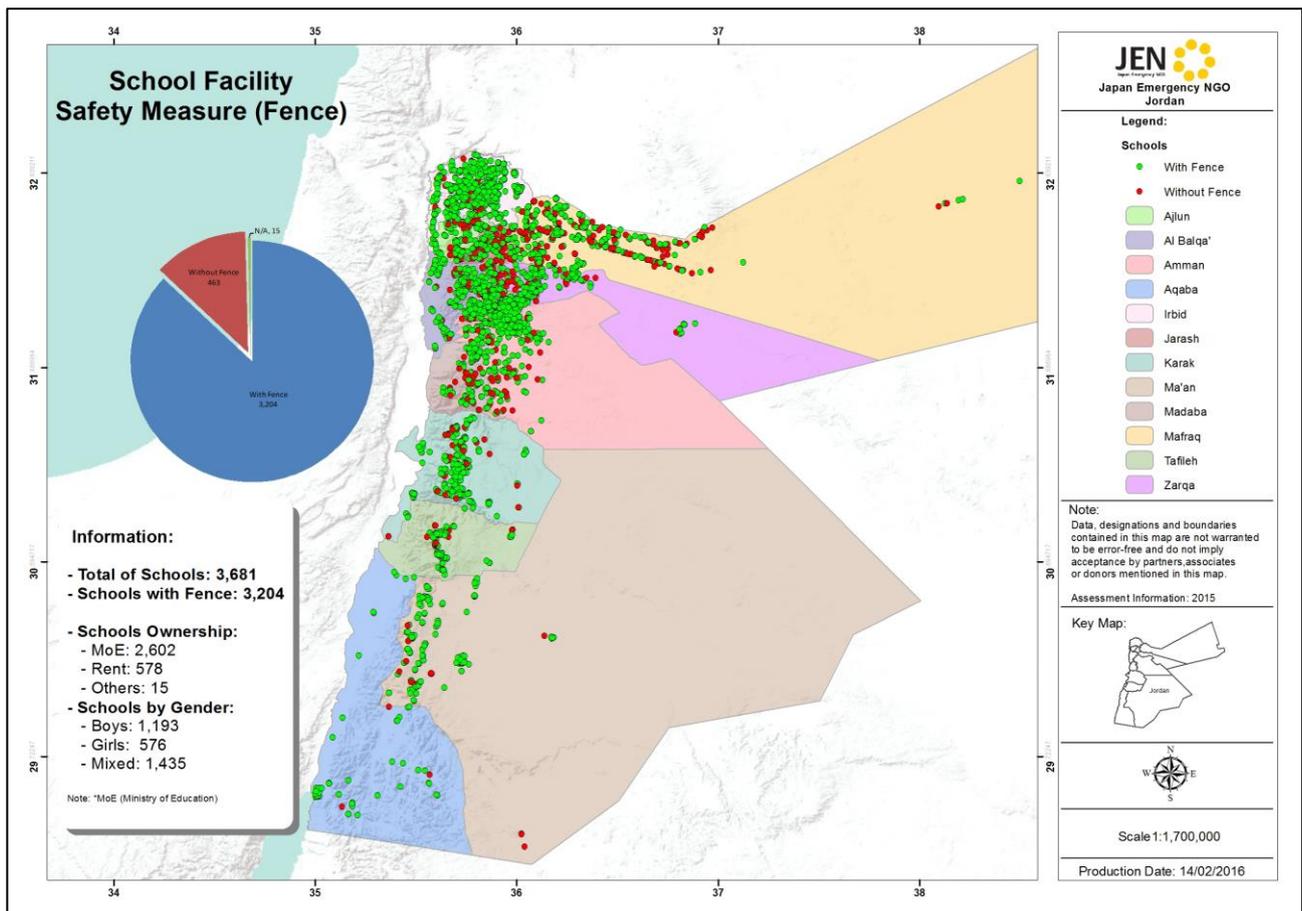

To improve security in schools, costs of installation of protection walls are estimated as follows.

**Cost estimation 3: Installation of a protection wall**

Priority	Criteria	Targeting Schools	Total Cost JD
FIRST priority	- MoE-owned schools	154	7,700,000
	- No wall/fence		
	- No guard		
FIRST priority	- MoE- owned schools	152	7,600,000
	- No wall/fence		
	- Presence of a guard		
<b>TOTAL</b>		<b>306</b>	<b>15,300,000</b>

Conditions of estimation:

- ✓ Size: Height 2 m x Thickness 0.30 m
- ✓ Materials: Hollow blocks
- ✓ Average perimeter of a school without a wall/fence: 250 m
- ✓ Costs per school: JD 50,000 (JD 200 per meter x 250 m)

**Map 4 Safety Measure (Fence) in Schools**

### Playground

The availability of a playground was observed by the JEN surveyors. In this assessment, playground is defined as enough outdoor space to offer children fresh air, space to meet friends, space to exercise and where it is paved by asphalt. 45% (1,646) of the schools have no playground (Figure 31). The unavailability of a playground/yard has two different causes; lack of space and lack of pavement.

The proportion of schools without a playground is highest in rented/partially-rented schools; 81% of rented/partially-rented schools lack the space for a playground. Most of these schools use family houses as the school buildings, which is the reason that space is limited.

Fewer schools in rural areas face a crisis over the lack of play space. Therefore, the main reason for the unavailability of a playground in schools in rural areas is associated with a lack of pavement.

Figure 31 Number of assessed schools: School playground and space availability

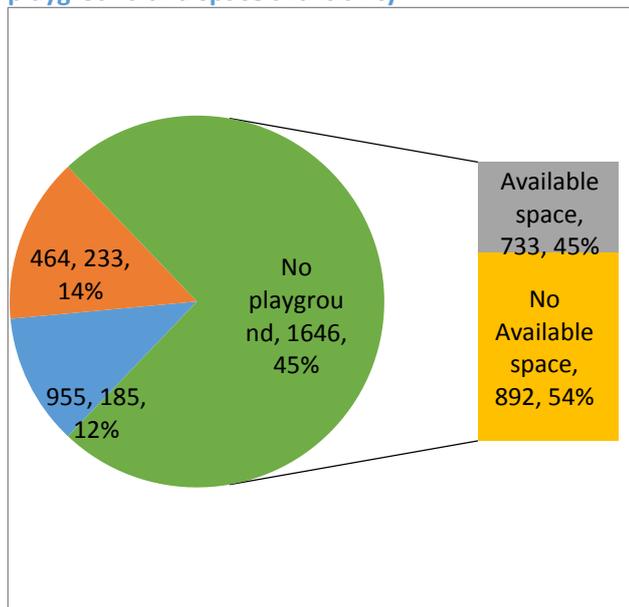

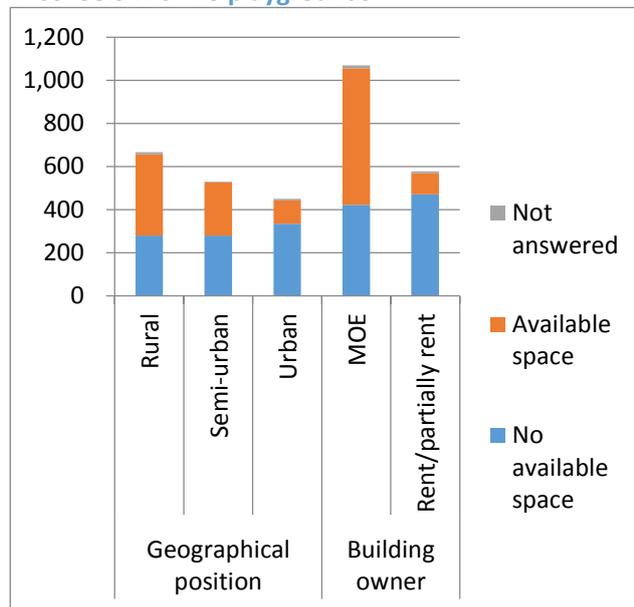

Figure 32 Availability of space for building classrooms in schools with no playgrounds

To improve the school environment, costs of playground construction is estimated as follows. Concerning schools where there is little space for expansion of classrooms, new school construction could be an option.

#### Cost estimation 4: Construction of a playground

Priority	Criteria	Targeting Schools	Total Cost JD
FIRST priority	- MoE-owned schools - Empty space available - No playground	754	67,860,000
TOTAL		754	67,860,000

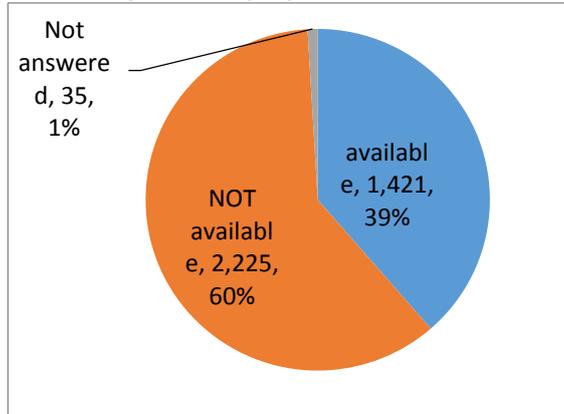

Conditions of estimation:

- ✓ Size of playground: 1,056 m<sup>2</sup> (44 m x 24 m)
- ✓ Specifications: Asphalt-paved
- ✓ Estimated costs per playground: JD 90,000
- ✓ The exact size of space available for construction has not been measured in each school.

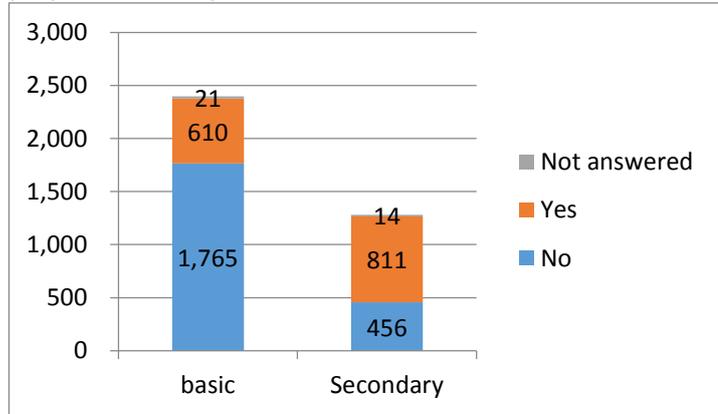

School principals were asked about the availability of a multi-purpose space. A multi-purpose room maybe used as a vocational training room, drawing room and kitchen etc. where students could learn through

hands-on activities. Secondary schools are proportionally more likely to have a multi-purpose room than primary schools.

**Figure 33 Number of assessed schools: Availability of multi-purpose rooms**

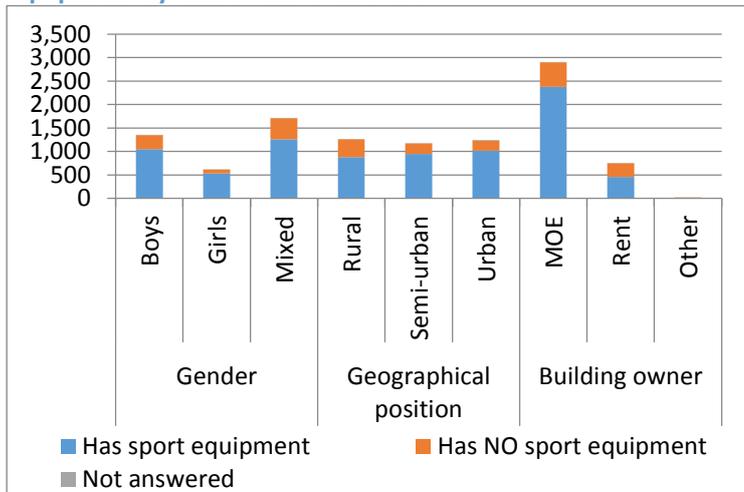

**Figure 34 Number of assessed schools: Availability of multi-purpose rooms by educational level**

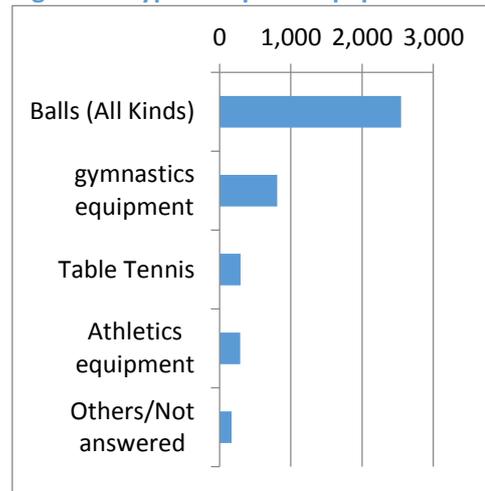

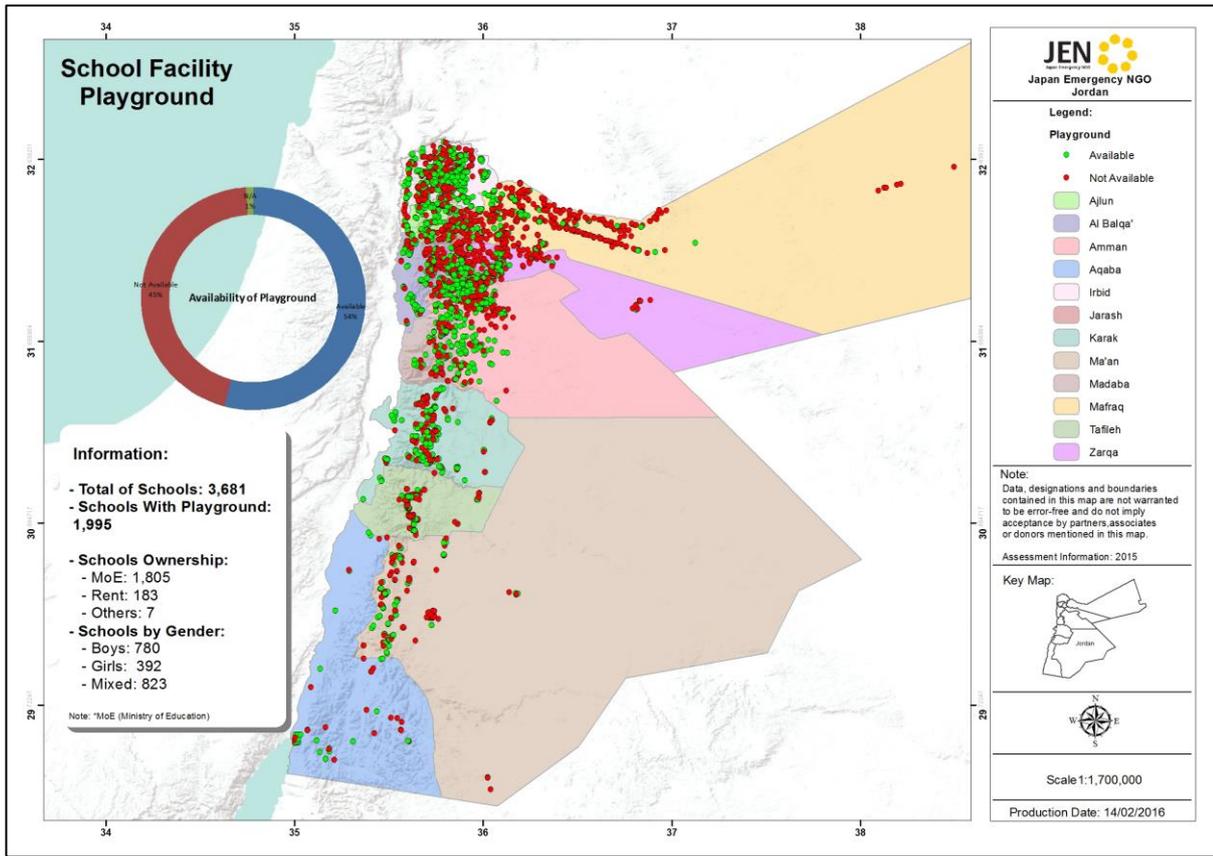

Sports equipment was available in 77% of the schools and the most common item was sports balls. Schools in rural areas are not as well equipped. In addition to being less likely to have playground space, schools in rural areas might not prioritize sports equipment due to limited financial resources or teachers.

**Figure 35 Number of assessed schools: Availability of sports equipment by characteristic features**

**Figure 36 Types of sports equipment**

Map 5 Playground in Schools

**School Premises and Equipment**

The age of school buildings varies; 16% of the schools were built less than 10 years ago, 34% of the schools were constructed 10-30 years ago, 32% were built 30-50 years ago and 16% were constructed over 50 years ago.

The availability of fire extinguishers and first aid kits is 82% and 90% respectively.

Figure 37 Number of assessed schools: Construction years of the school buildings

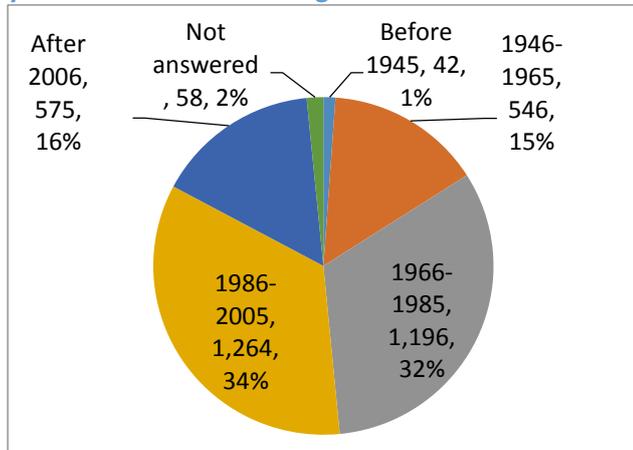

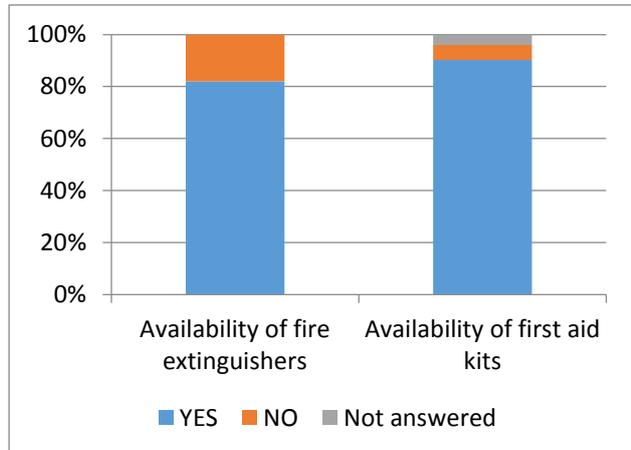

Figure 38 Availability of fire extinguishers and first aid kits

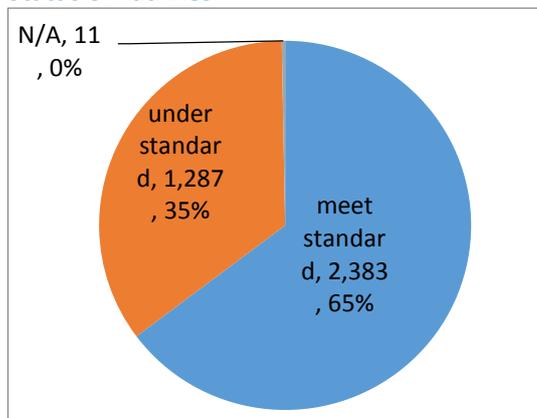

### Latrines

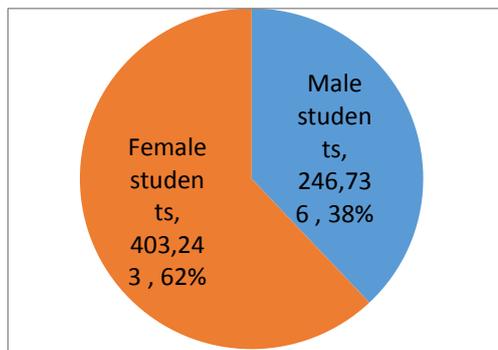

The Jordanian minimum student-to-latrine compartment ratio differs by gender: 45 students per seat in girls’ schools, 75 students per seat in a boys’ schools and 60 students per seat in a mixed school. 35% (1,287) of the schools, fail to meet these standards and it is assumed that 649,979 students, approximately half of all public school students suffer due to insufficient latrine facilities.

As (Figure 41) shows, 63% or 388 girls’ schools fall below the standard for number of seats. 29% or 392 boys’ schools and 29%, or 497 mixed schools also do not meet the standards. By geographical classification, 48%, (598) of schools located in urban areas faced inadequate latrines mainly because of the high concentration of students and lack of space. There is little difference in the latrine status between MoE-owned schools and rented schools. The number of female students in schools which fell below the standards is 1.6 times higher than that of male students in the same category (Figure 40).

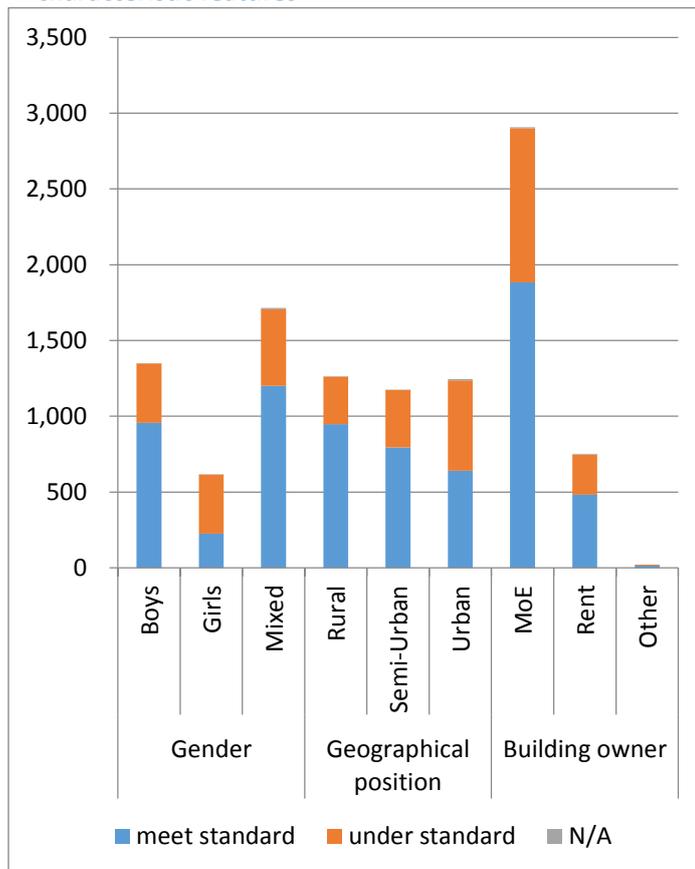

**Figure 39 Number of assessed schools: Status of latrines**

**Figure 40 Number of students: Status of latrines and gender implications**

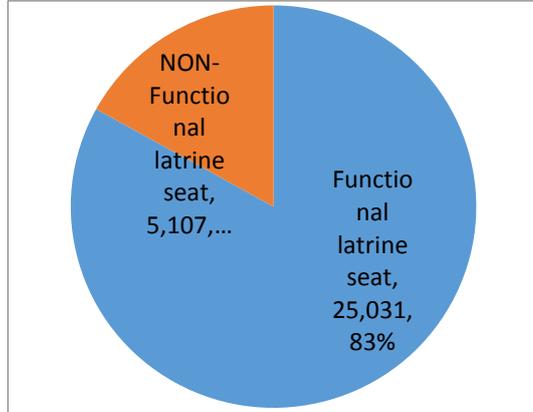

**Figure 41 Number of assessed schools: Status of latrines by characteristic features**

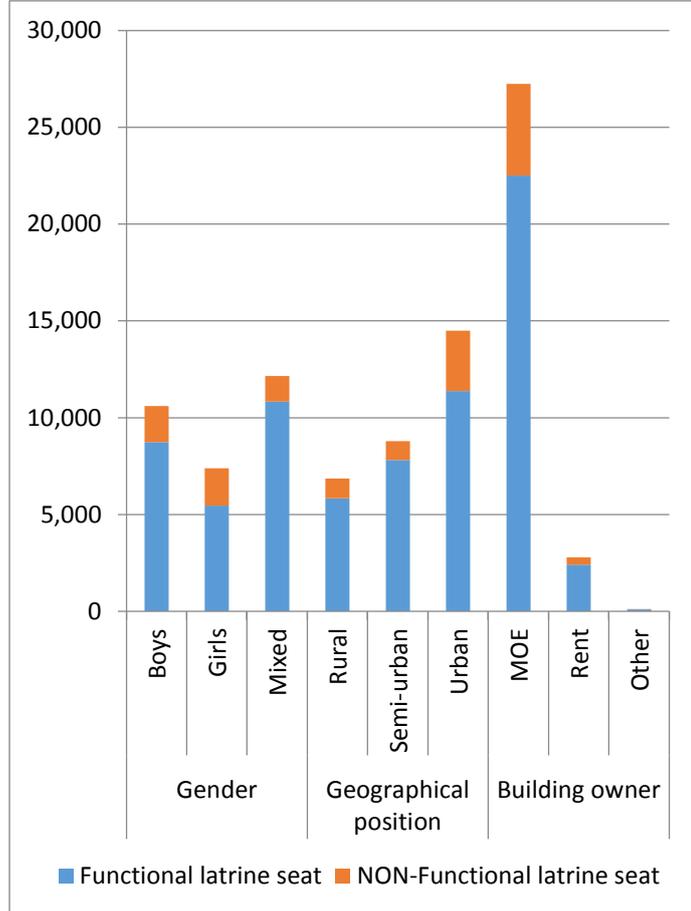

The inadequacy of seats is caused not only by the shortage of latrine seats but also by a large number of unusable latrine seats. 17% of the existing latrine seats, 5,107 were not usable (Figure 42). As (Figure 43) shows, the percentage of unusable latrine seats is high in girls’ schools and also in schools in urban areas, which is one of the reasons that the percentage of the schools falling below minimum standards is high in those schools. Making these unusable latrines functional, would reduce the number of schools below the minimum standards from 1,287 to 929 schools (Figure 44). The costs of rehabilitation of one seat are around one fifth of the costs of construction of a new latrine; therefore, rehabilitation should be completed first.

Out of the 1,032 schools with unusable seats, 480 schools have an adequate number of usable seats in which repairing of usable latrines is not a priority. However, it should be taken as a second priority in case of classroom expansion.

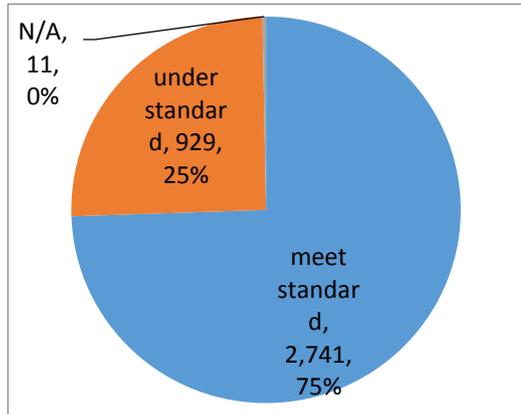

**Figure 42** Number of latrine seats and accessibility

**Figure 43** Number of latrine seats and accessibility by characteristic features

**Figure 44** Number of assessed schools: Status of latrines after rehabilitation

To improve the access to latrines, costs of rehabilitation of unusable/broken/damaged latrines are estimated as follows.

**Cost estimation 5: Rehabilitation of unusable/broken/damaged latrine seats**

Priority	Criteria	# Targeted Schools	# latrine seats	Total Cost JD
FIRST priority	<ul style="list-style-type: none"> <li>Both MoE-owned and rented/partially rented schools</li> <li>There are unusable/broken/damaged latrine seats</li> <li>Student-to-latrine compartment ratio is below the minimum standards</li> </ul>	549	2,439	1,829,250
SECOND priority	<ul style="list-style-type: none"> <li>Both MoE-owned and rented/partially rented schools</li> <li>There are unusable/broken/damaged latrine seats</li> <li>Student-to-latrine compartment ratio is above the minimum standards</li> </ul>	481	1,446	1,084,500
TOTAL		1,030	3,885	2,913,750

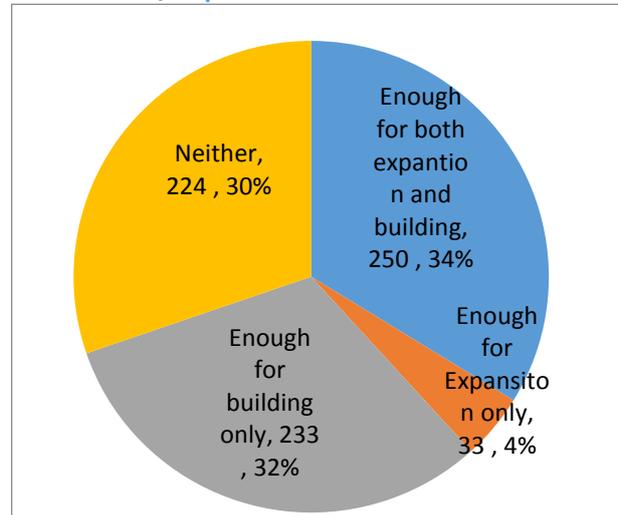

Conditions of estimation:

- ✓ Main items of rehabilitation work comprise as follows: Replacement/maintenance of eastern latrine seats, tiles, lights, doors, water tanks, waste water network and wall painting.
- ✓ Costs per seat: 750 JD

Even if all possible unusable/broken/damaged latrines are rehabilitated, 929 schools would still be classified as falling below the minimum standards. In those schools, the expansion of existing latrines or construction of new latrine blocks is required. Rented schools will not be targeted for construction as the facilities do not belong to MoE. Therefore, merely 740 MoE-owned schools are considered viable for the plan. Expansion requires space around existing latrines, while construction needs empty space within the school compound. However, empty space is not necessarily close to the existing latrines.

Out of the 740 MoE-owned schools, 224 schools have neither space for expansion nor for construction in (Figure 45). For those schools, there is no solution except for decreasing the number of students or converting other rooms into latrines. Decreasing the number of students would require new schools to accommodate overflow children and should be considered as a part of new schools construction plan. On the other hand, converting other rooms into latrines would not be complex as long as such space is not already being used in schools. In JEN’s WASH in schools program, there were several cases of schools converting an unused room such as a storage closet into a latrine. This possibility should be taken into consideration.

**Figure 45 Availability of space for latrine construction/ expansion in MoE owned schools**

The following shows estimated costs for expanding current latrines or construction of new latrine blocks in schools where there is enough space. Due to lack of information, the possibility of converting other rooms into latrines is excluded from the cost estimation.

**Cost estimation 6: Construction of additional latrine facilities**

Priority	Criteria	Targeting Schools	# of latrine seat	Total Cost JD
FIRST priority	<ul style="list-style-type: none"> <li>- MoE-owned schools</li> <li>- There is a space either for expansion or for construction</li> <li>- Student-to-latrine compartment ratio is below minimum standard even after unusable seats are fully rehabilitated</li> </ul>	516	1,927	6,359,100
TOTAL		516	1,927	6,359,100

Conditions of estimation:

- ✓ Size of one latrine seat: 1.20 meters X 1.50 meters
- ✓ Costs per seat: 3,300 JD

Latrines separated by gender are essential in mixed schools. However, latrines in 61% (1,040) of the mixed schools are not segregated. It is prominent in rural areas as well as in rented schools.

As (Figure 48) shows, the number of female students with no access to segregated latrines is triple the number of male students, which reflects the gender ratio in the mixed schools, 27% for male students and 73% for female students. Therefore, the main reason female students have less access to segregated latrines is likely due to the lower opportunity for females to attend girls' schools.

Figure 46 Availability of gender-segregated latrines in mixed schools

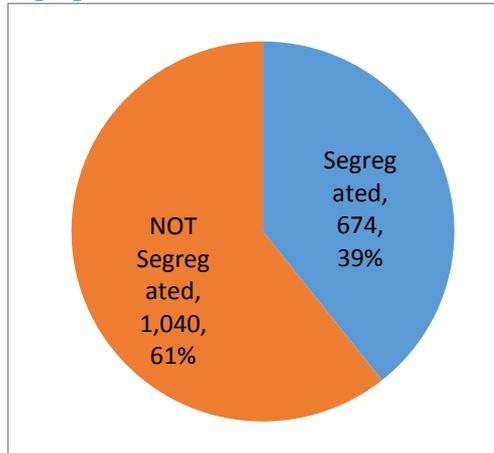

Figure 47 Availability gender-segregated latrines in mixed schools by characteristic features

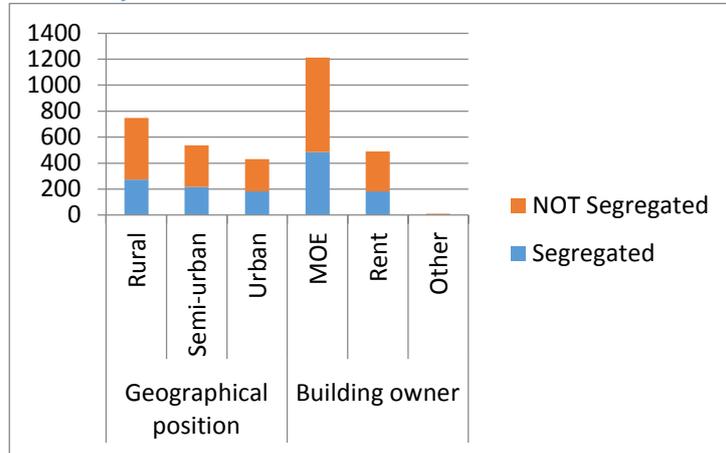

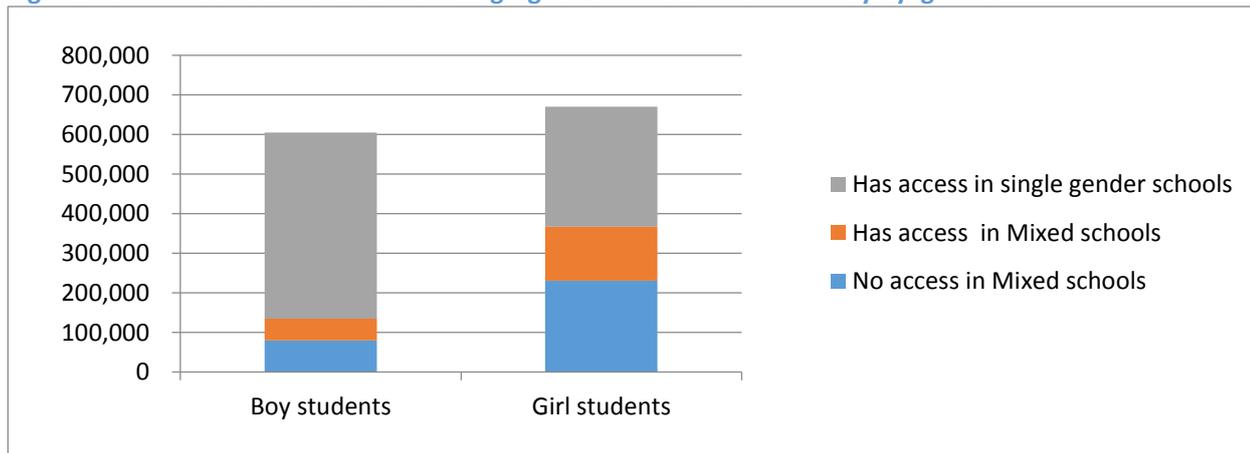

Figure 48 Number of students: Gender-segregated latrines and availability by gender

To improve the girls access to segregated latrines in mixed schools, costs of installation of partitions in unsegregated latrines is estimated as follows.

Cost estimation 7: Installation of a partition

Priority	Criteria	Targeting Schools	Total Cost JD
FIRST priority	- Both MoE-owned and Rented/partially-rented schools - No gender-segregated latrines	1,040	691,600
TOTAL		1,040	691,600

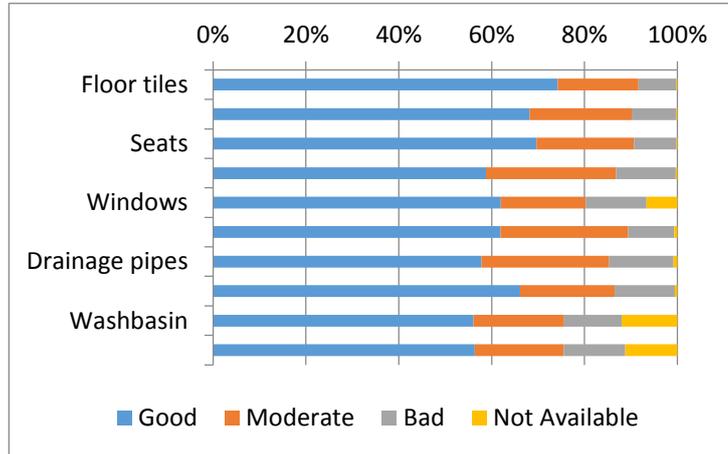

Conditions of estimation:

- ✓ Size of a partition: Length 6m x Height 2.8m x Width 0.15m
- ✓ Materials: Blocks, plaster and paint, door, sink
- ✓ Costs per partition: JD 665

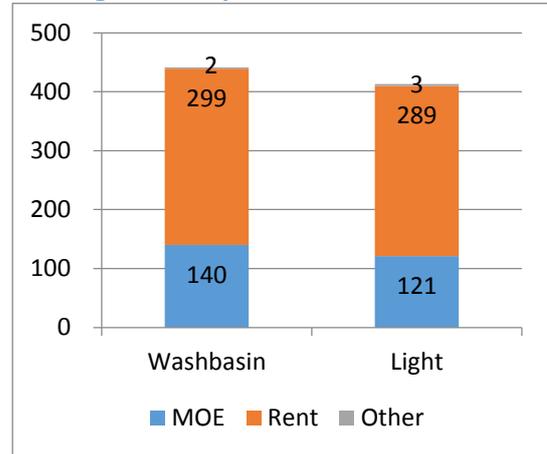

The physical condition of latrine facilities was evaluated by examining the condition of walls, floors, seats, doors, water pipes, drainage pipes, ceiling and washbasins and others.

As (Figure 49) shows, no particular part in the assessment was seen as a main cause of bad conditions of latrines among those parts. Around 400 schools reported that washbasins and lights are unavailable. Approximately 70% of those schools are rented schools (Figure 50). In rented schools, it is not uncommon that only latrine stalls are constructed, not latrine blocks/buildings, without washbasins, electrical wire connections and doors in the worst case.

**Figure 49 Percentage of assessed schools: Student latrine conditions**

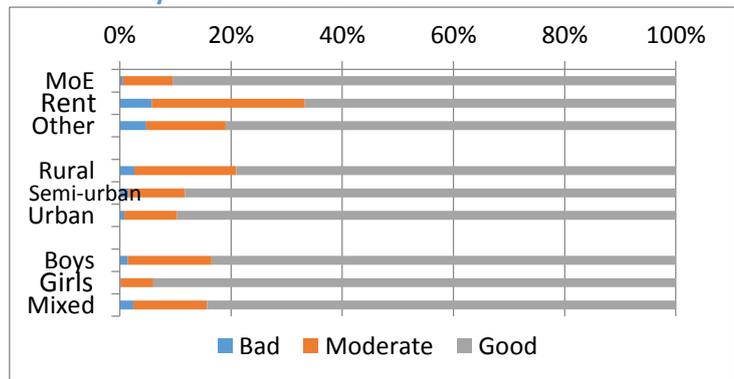

**Figure 50 Number of assessed schools: Availability of washbasins and lights by building ownership**

In evaluation of latrine facilities as a whole, each part was assigned a score out of a maximum weighted score. The score of each part was summed up, which is used to categorize the overall latrine condition into good, moderate and bad.

When looking into latrine conditions by characteristic features (Figure 51), rented school latrines are more likely to be in bad or moderate condition. Latrine facilities in girls' schools are in better condition than boys' and mixed schools.

**Figure 51 Percentage of assessed schools: School latrine conditions by characteristic features**

Children's willingness to use school latrines could be affected by the level of maintenance as well as the cleanness of latrines. In most Jordanian public schools, cleaning is conducted by MoE-hired school cleaners. As (Figure 52) shows, in 82% of the schools facilities are cleaned more than once per day. The frequency of cleaning in girls' schools and in schools in urban areas is higher than others.

86% of the schools have one or two cleaners. Out of the 261 schools without cleaners, 94%, 246 schools, have less than 500 students (Figure 53). Assignment of cleaners seems to depend on the number of students and the sizes of the school.

Figure 52 Frequency of cleaning per week

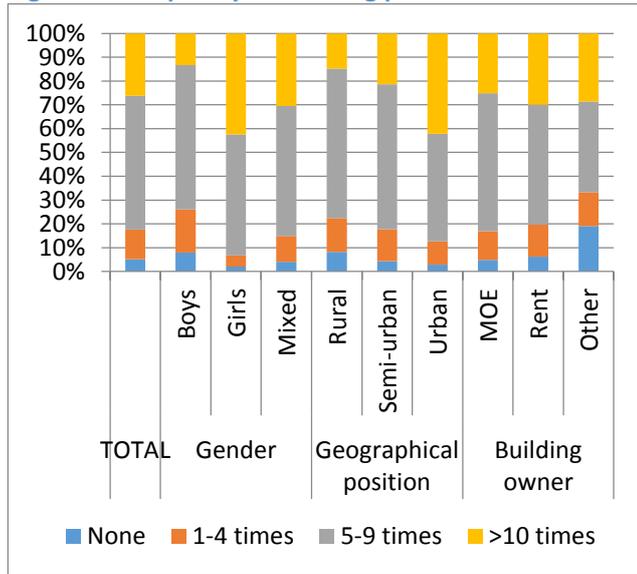

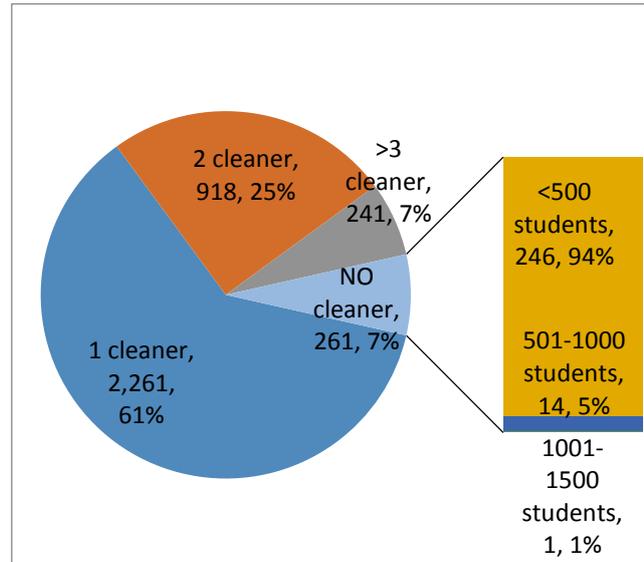

Figure 53 Number of assessed schools: Availability of cleaners and the sizes of schools with no cleaners

Based on the surveyors' direct observation, schools were categorized as clean or not-clean. 16% of the schools were classified as not-clean (Figure 54). As Figure 55 shows, facilities in boys' schools tend to become filthy based on the condition of school latrines. Around a quarter of boys' schools lack cleanliness.

Figure 54 Number of assessed schools: Cleanliness in schools

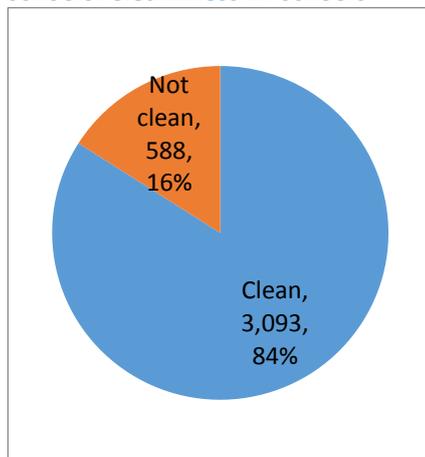

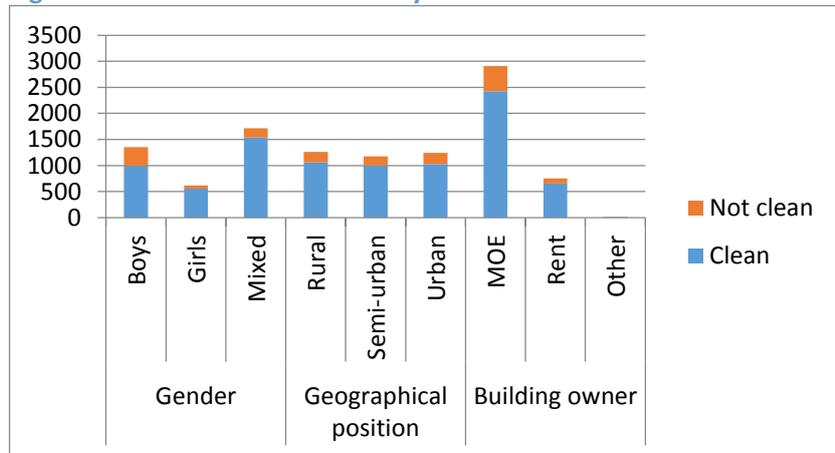

Figure 55 Cleanliness in schools: by characteristic features

The cleanliness of schools is not necessarily linked to the frequency of cleaning or the number of cleaners. Out of the schools categorized as not-clean, 79% have regular cleaning (Figure 56) and 88% have more than one cleaner (Figure 57). On the other hand, the proportion of schools with poor latrine condition is higher in schools which were classified as unclean (Figure 58). This indicates that cleanliness could depend on correct behavioral practices of children rather than cleaning frequency.

Figure 56 Number of unclean schools and the frequency of cleaning per week

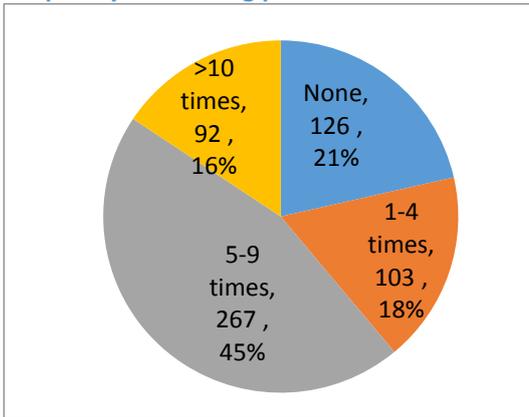

Figure 57 Number of unclean schools and the number of cleaners

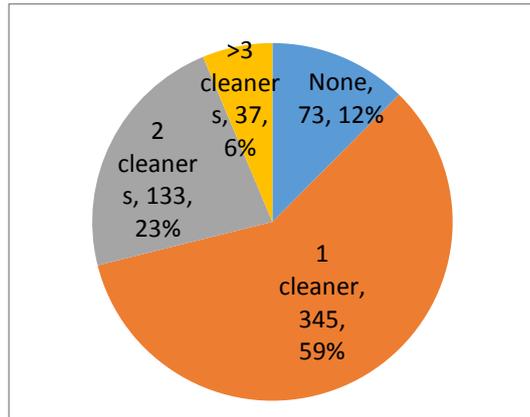

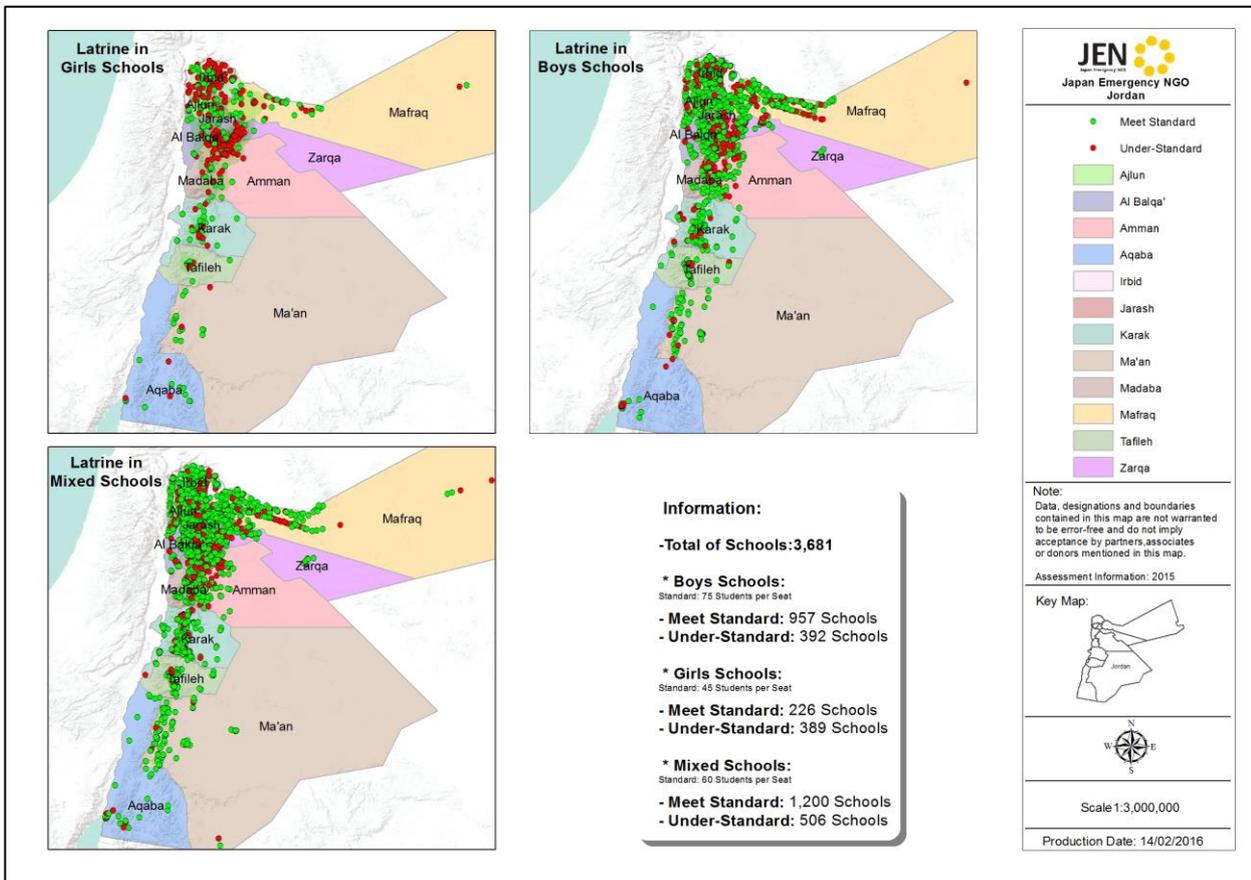

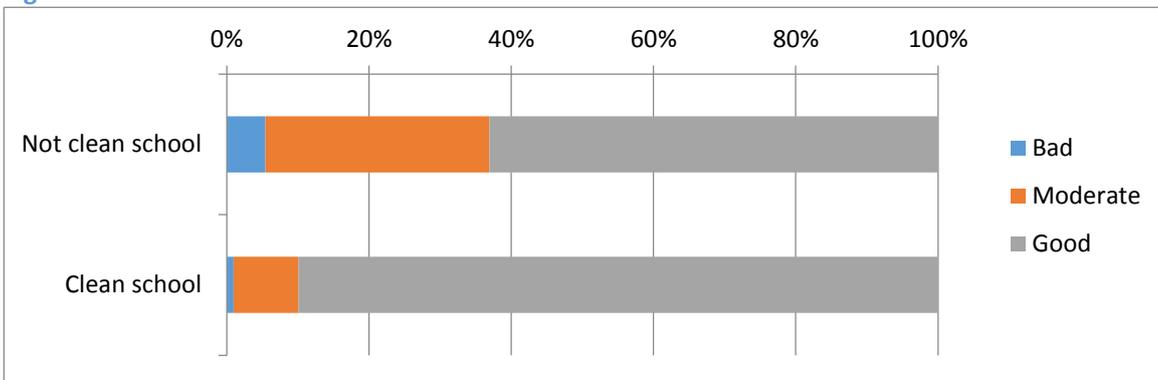

Figure 58 Conditions of latrines in clean and unclean schools

Map 6 Latrine distribution by gender

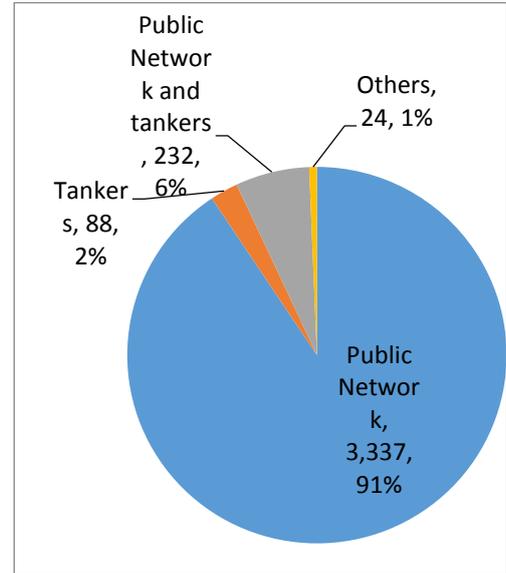

**Water**

It is important to ensure availability and sustainable management of water for students and to maintain a hygienic environment for all. In Jordanian public schools, water is delivered through public water networks or by water tankers. Public water is not delivered daily and the frequency of water delivery differs by the area. Therefore, schools need to have the capacity for storing an adequate amount until the next water delivery. In the areas where public water networks are not connected to the schools, schools have to rely on water tankers which usually come to fill water tanks upon request.

Only 2% (88) of the schools are not connected to public water networks and rely on water tankers, 62 of these 88 schools are owned by the MoE. 232 schools have access to public water networks and also purchase water from water tankers when needed. 3,337 schools consume water from public networks alone.

To ensure regular access to a sufficient quantity of water, costs of connection of schools to public water networks are estimated as a follow.

**Figure 59 Number of assessed schools: Main water resources**

**Cost estimation 8: Connection to a public water network**

Priority	Criteria	Targeting Schools	Total Cost JD
FIRST priority	- MoE-owned schools - No connection to public water networks	62	434,000
TOTAL		62	434,000

Conditions of estimation:

- ✓ Types of Pipes: H.D.P.E (High Density Polyethylene) with Nominal Diameter 32 ml - 63 ml
- ✓ Roughly-estimated distance from the main line of public water networks to school: 100 m
- ✓ Costs per school: JD 7,000 (70 JD per meter \* 100 m)

Sphere Standards set minimum quantities of water in schools as 3 liters per pupil per day for drinking and handwashing, 1-2 liters per user for handwashing and 2-8 liters per cubicle per day for latrine usage. Quantity of water available per child depends on the frequency of water delivery and the capacity of water storage. Frequency of water delivery from public water networks is decided by area and the average frequency in assessed schools was 5 times per month. Therefore, it cannot be said that those schools connected to the public network have enough water quantity. As water delivery cannot be changed to being upon request from schools; the main solution would be to install additional water tanks. In 40% (1,471) of the schools, 569,702 students did not have access to a sufficient quantity (10 liters per day) of water (Figure 60). As (Figure 61) shows, approximately half of the rented schools as well as about a third of MoE owned schools fall below the standards, which might be associated with the insufficient number of water tanks as well as lack of space to install additional water tanks. The number of female students who could not access a sufficient quantity of water was slightly higher than male students (Figure 62).

Figure 60 Number of assessed schools: Adequacy of water supply

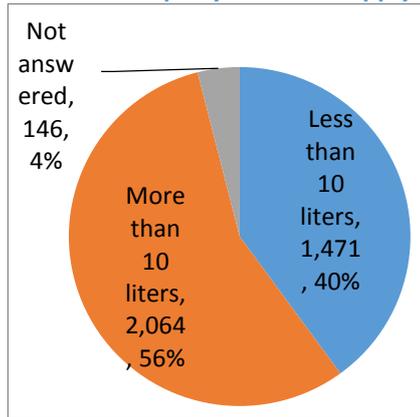

Figure 62 Number of students: Daily water usage under 10 liters per day by gender

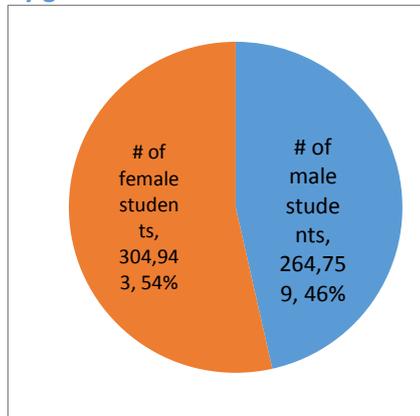

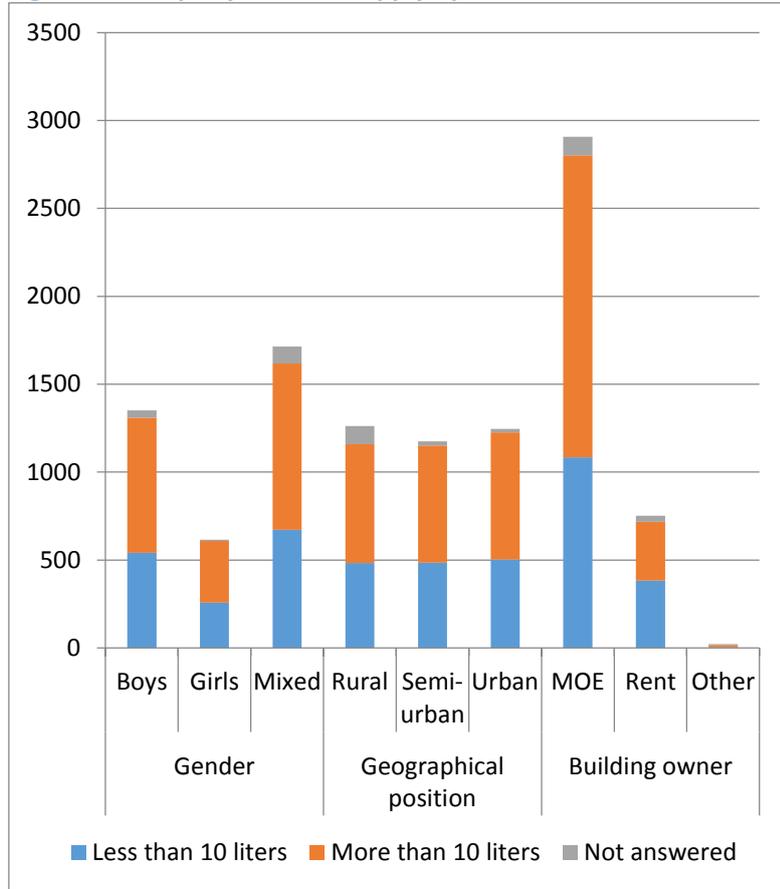

Figure 61 Adequacy of water supply by characteristic features

To ensure the access to a sufficient quantity of water for students, costs of installation of additional water tanks are estimated as follows. Generally water tanks are installed on the rooftops of buildings. As the space availability of the roof was not assessed, the cost estimation below is calculated on the assumption that targeted schools have enough space for installation of water tanks.

Cost estimation 9: Installation of additional water storage tanks

Priority	Criteria	# Targeted Schools	# Required water tanks	Total Cost JD
FIRST priority	- Both MoE-owned and rented/partially rented schools - Availability of water supply per child per day is less than 10 liters	1,471	6,847	1,711,683
TOTAL		1,471	6,847	1,711,683

Conditions of estimation:

- ✓ Type of water tank: Metric 2,000 liters
- ✓ Costs per tank: 250 JD
- ✓ # of required water tanks is calculated by
  - ❑ Lack of enough water supply in each school: Actual water quantity per month - Required water quantity per month. (7 liters per child/day as the minimum)
  - ❑ Required number of water tanks in each school: Lack of water supply in each school / 2,000 liters

Conditions of water tanks as well as those of internal water networks were observed by the JEN surveyors. If internal water networks or water tanks are in disrepair, it would affect the quantity and the quality of water available for children. Only 3-4% of all the schools had water storage tanks or internal water networks in bad condition (Figure 63).

Well-maintained water taps are important for children to wash their hands after playing or before eating meals or drinking water. Generally water taps are installed in the school-yard, outside the main school buildings. Therefore, they are exposed to risks of vandalism. The proportion of schools with water taps in poor condition is high at 23% of all the schools compared with the conditions of water storage tanks or water networks. It is also worth noticing that water taps are not available in 9% of the schools. In addition, around 39% of taps were broken or missing (Figure 64). Non-functional taps were more common in boys' schools at 47% than girls' or mixed schools (Figure 65). In addition, rented schools were most likely to have functional taps while just over half of taps at MoE owned schools were functional. To avoid vandalism or looting of taps, some schools have taps inside the buildings or install grilles surrounding taps to secure them with pad locks.

Figure 63 Condition of water tanks, internal networks and water fountains

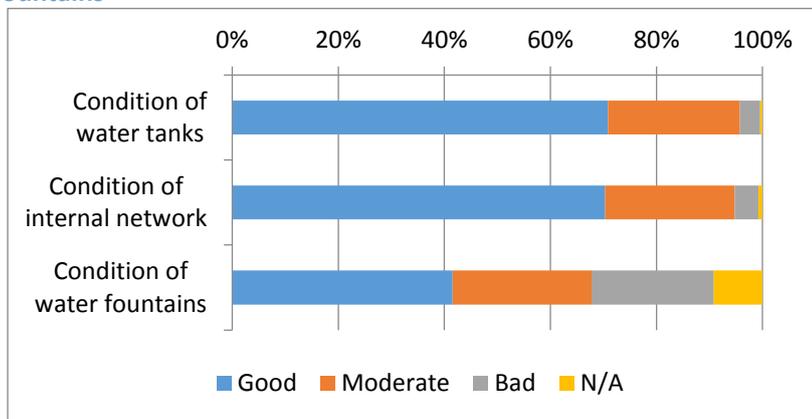

Figure 64 Accessibility and number of taps

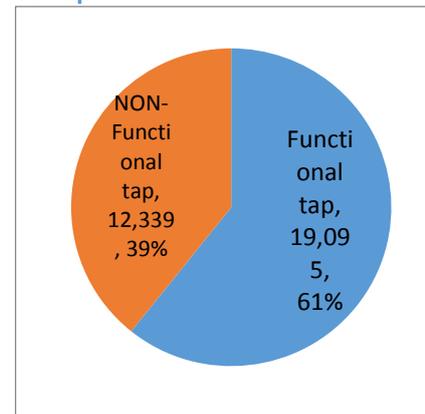

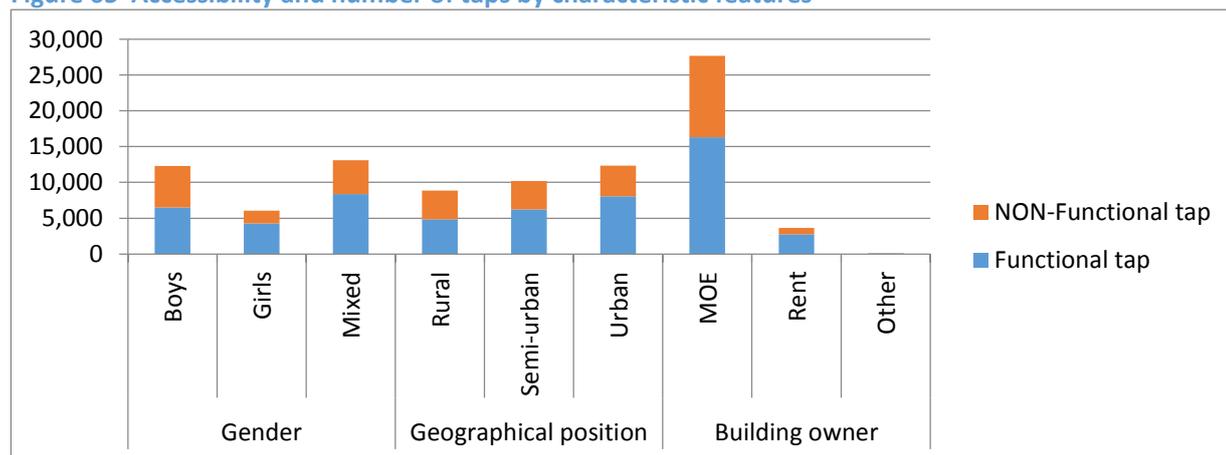

Figure 65 Accessibility and number of taps by characteristic features

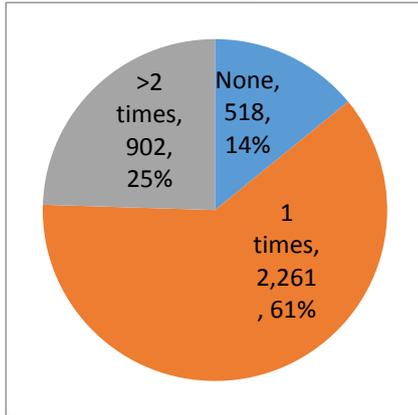

In order to prevent any contamination or water-borne diseases, it is essential to conduct regular water testing. According to our school principal interviews, 86% of the schools had water testing conducted during the last academic year (Figure 66) and the most of them successfully passed the test (Figure 67). The percentage of schools where water testing was not conducted is highest in rural areas at 21%. There is a possibility that some schools might be neglected due to difficulties associated with access and other reasons. Though schools' water usually passed water testing regular cleaning and disinfection of water

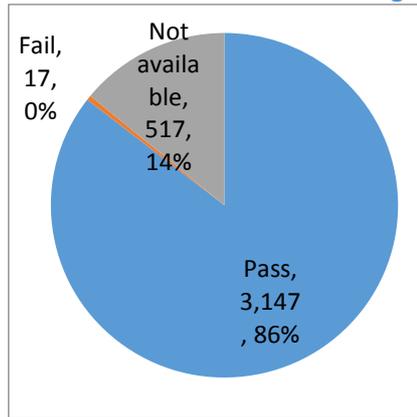

storage tanks is likely to decrease the risk of contracting water-borne diseases. This exercise was found in 98% of the schools as (Figure 68) shows.

For the 17 schools which failed to conduct water testing and 56 schools where disinfection of water storage tanks was not conducted, further investigation is required in order to find out a cause and to address it. Overall, ensuring water quality is relatively well managed and implemented.

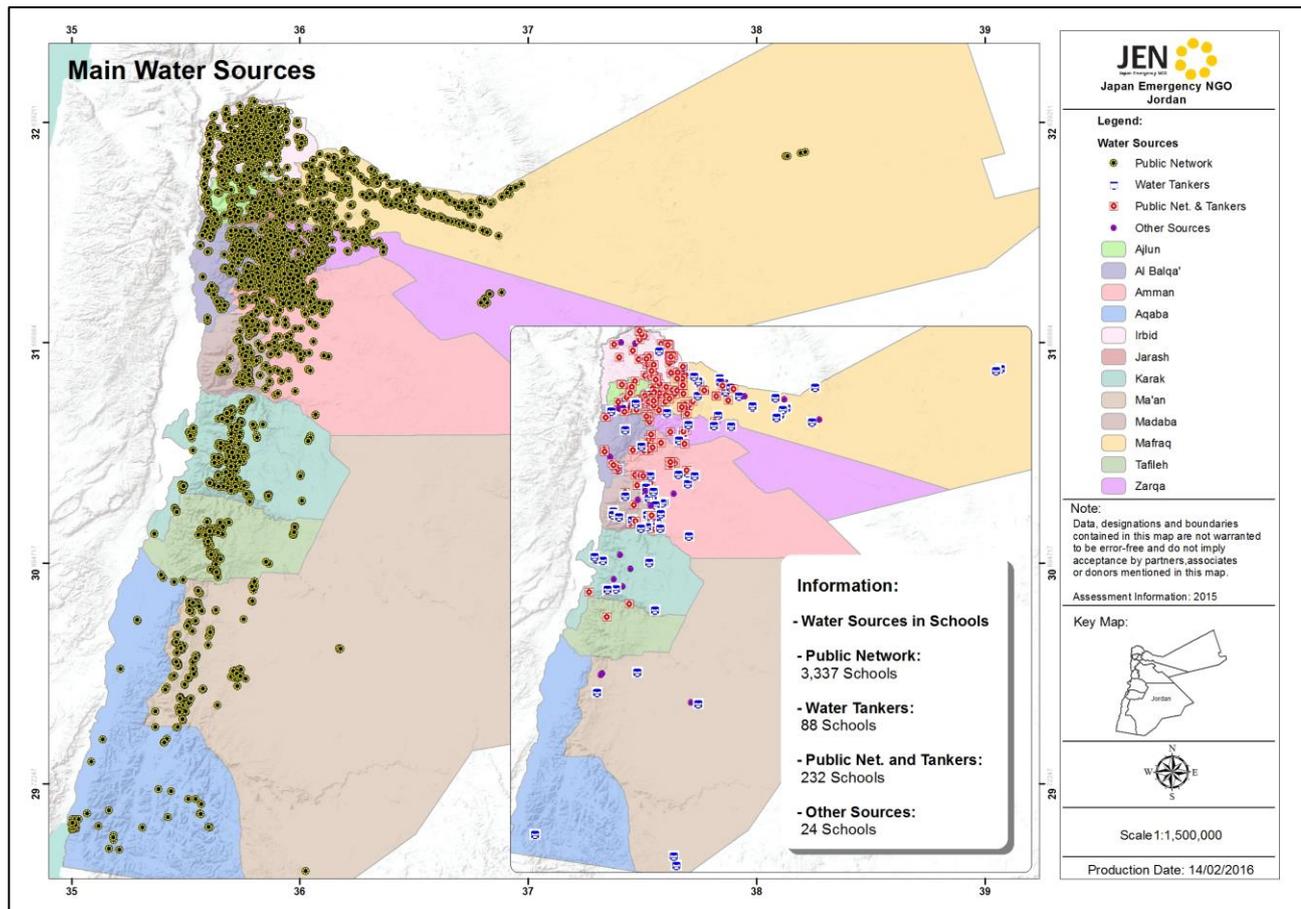

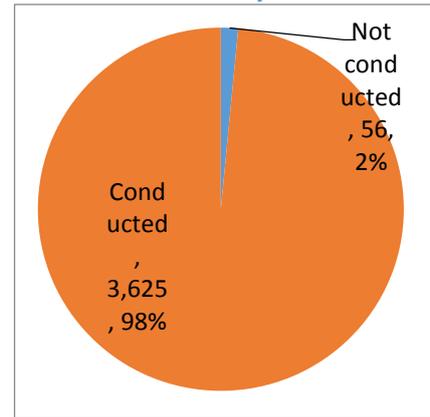

**Figure 66 Number of assessed schools: Frequency of water testing**

**Figure 67 Number of assessed schools: Results of water testing**

**Figure 68 Number of assessed schools: Cleaning and disinfecting water storage tanks during academic year**

**Map 7 Different water sources of schools**

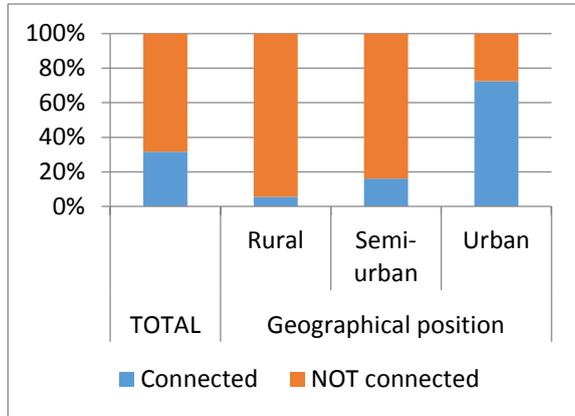

**Waste Water**

Concerning waste water, the number of schools which are connected to public waste water networks is very low. 68% of the schools are not connected (Figure 69).

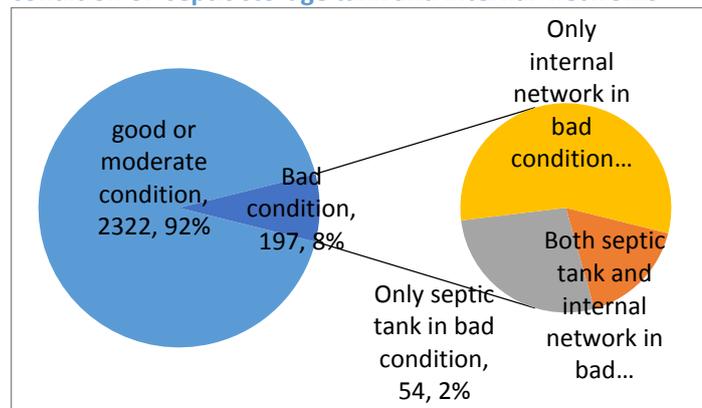

95% of the schools in rural areas have no public sewer connections. As long as the septic tanks are in good condition and desludging of septic tanks is regularly conducted, the lack of waste water connections would not be a big problem even though the recurrent costs might be kept high.

Out of the 2,519 schools without connections, in (Figure 70), 33 schools had both septic storage tanks and an internal network system in bad condition, 54 schools with septic storage tanks in poor condition and 110 schools had internal networks in poor condition. For these 197 schools with internal sewage problems, connecting to a public sewer would be a priority.

**Figure 69 Number of assessed schools: Connection to public sewers by geographical classification**

**Figure 70 Schools with no public sewer connection and condition of septic storage tank and internal networks**

To improve a sewage system in schools, costs of connection to sewage networks are estimated as follows.

**Cost estimation 10: Connection to a public sewage network**

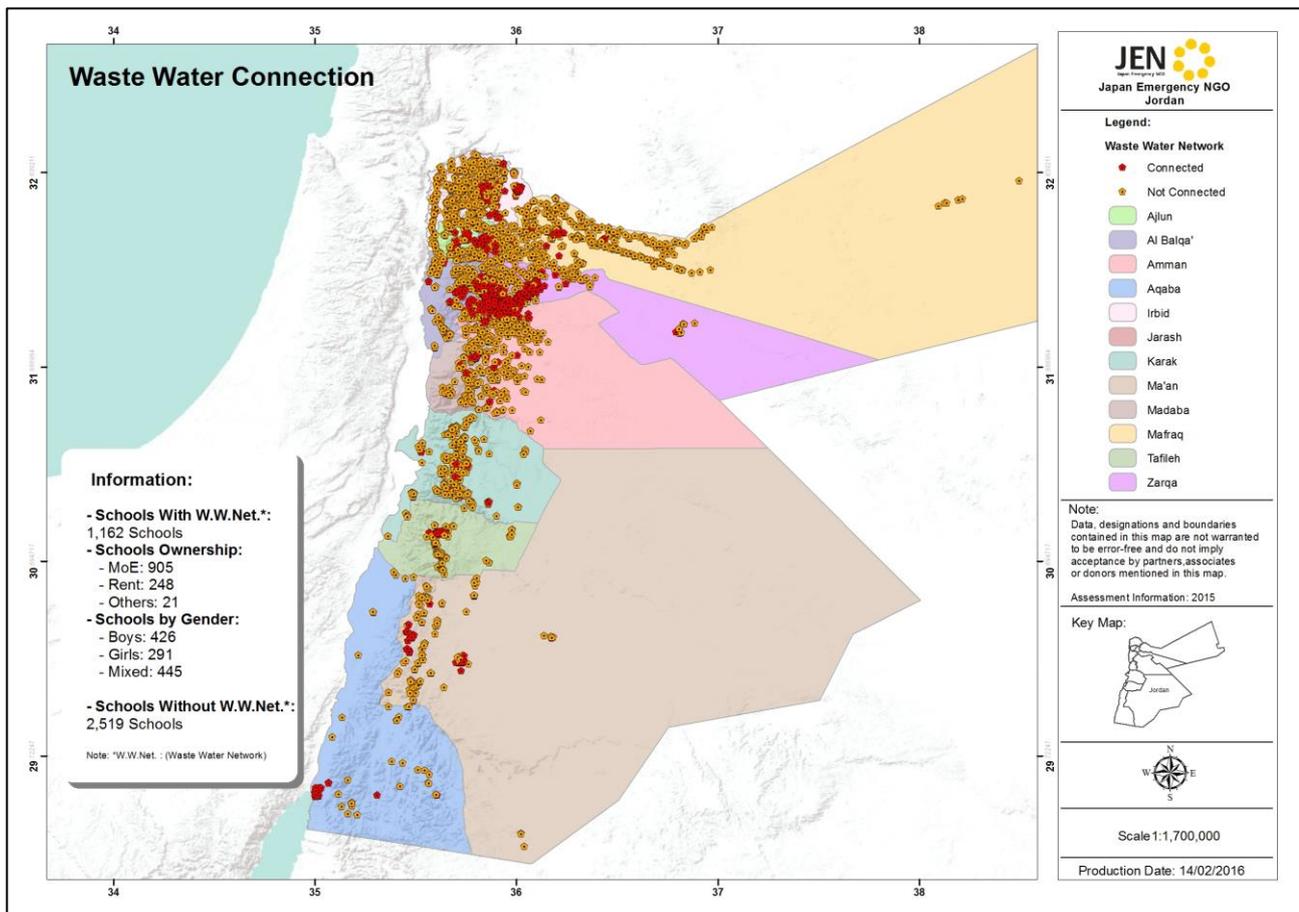

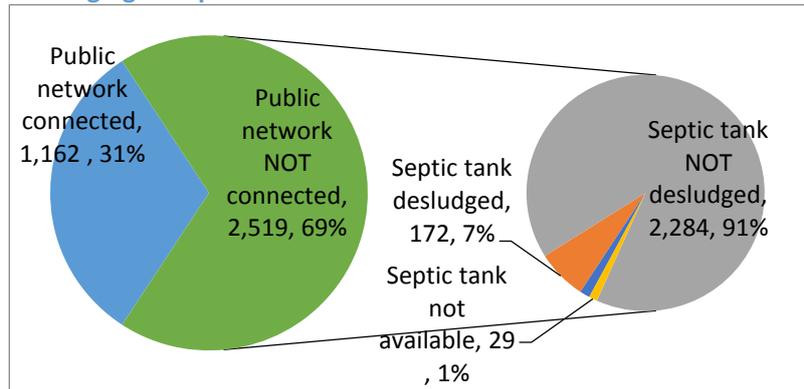

Priority	Criteria	Targeting Schools	Total Cost JD
FIRST priority	- MoE-owned schools - No connection to public waste water network system - Has internal sewage system in bad condition	135	1,417,500
SECOND priority	- MoE-owned schools - No connection to public waste water network system - No internal sewage system in bad condition	1,868	19,614,000
TOTAL		2,003	21,031,500

Conditions of estimation:

- ✓ Type of pipe: Plain Concrete with Nominal Diameter 150 mm - 200 mm
- ✓ Estimated distance from the main line of public waste water network to school: 100 m
- ✓ Costs per school: 10,500 JD ( [80 JD per meter X 100 m] + [5 manholes X 500 JD])

As shown in (Figure 71), 91% of the schools were not connected to public sewers and none of them have desludged septic storage tanks in the last two academic years. This percentage seems high, however, it is very rare to find septic storage tanks overflowing in schools. It is assumed that some substances septic storage tanks contain have been absorbed into ground. Detailed investigation is required for this.

Figure 71 Number of assessed schools: Public sewer connection and desludging of septic tanks

Map 8 Connectivity to waste water network

### Solid Waste

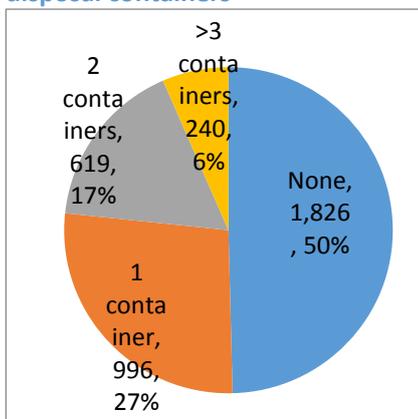

School waste disposal is an important issue to keep school environments clean and hygienic. The mismanagement of solid waste could result in outbreaks of insects and increased risks of diseases. In this assessment the situation of outdoor waste disposal containers was assessed. All school solid waste is collected and stored in these containers until a public waste disposal vehicle collects the waste.

50% of the schools have no waste disposal containers. In schools equipped with waste disposal containers, the number of containers varies (Figure 72). However, the size of these containers was not observed in the assessment and therefore, it is difficult to confirm whether each of those schools has enough capacity to store all school waste. 73% (2,698) of the schools, however, answered that the existing capacity of the containers are insufficient to keep all waste in the public waste collection cycle as shown in (Figure 73). This indicates that even schools equipped with waste disposal containers will need additional storage capacity for collecting all waste.

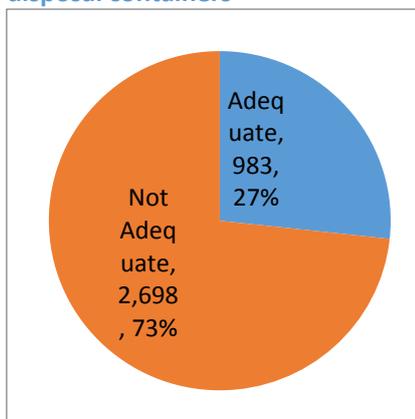

In the public waste collection cycle shown in (Figure 74), school solid waste is not collected regularly in 48% (1,755) of the schools, out of which, 1,479 schools have no waste disposal containers. It is assumed that those schools are rather not counted as a waste collection point than public waste collection service is unavailable.

Schools without solid waste management practices burnt trash on the school premises or just left it scattered in and around the school yards.

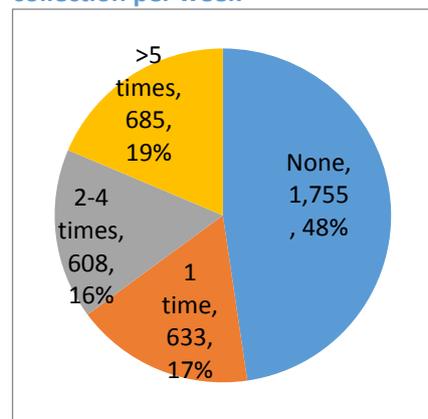

**Figure 72 Number of assessed schools: Availability of waste disposal containers**

**Figure 73 Number of assessed schools: Adequacy of waste disposal containers**

**Figure 74 Number of assessed schools: Frequency of public waste collection per week**

To improve solid waste management, estimated costs of provision of waste disposal containers is as follows.

#### Cost estimation 11: Provision of waste disposal containers

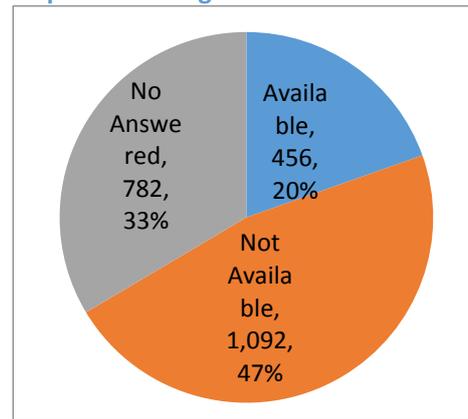

Priority	Criteria	Targeting Schools	Required # of containers	Total Cost JD
FIRST priority	- Both MoE-owned and rented/partially rented schools - No waste disposal containers available	1,826	10,783	1,347,869
SECOND priority	- Both MoE- owned and rented/partially rented schools - There are waste disposal containers but they are not enough	872	6,291	786,341
TOTAL		2,698	17,074	2,134,210

Conditions of estimation:

- ✓ Type of a container: Metric 250 liters with wheels
- ✓ Costs per container: 125 JD
- ✓ # of required waste disposal containers is calculated by
  - ❑ Estimated total quantities of solid waste in each school: Number of students x 1.8 liters per day x 2.5 days (collection cycle)
  - ❑ Required No. of waste disposal containers in each school: Estimated total quantities of waste in each school / 250 liters

In addition to outdoor trash containers, the availability of sanitary disposal bins in female latrines was assessed. As the idea is not culturally common in Jordan, one third of the schools left this question unanswered. However, out of the 1,548 schools which answered the question, 71% of the schools have no sanitary disposal bins (Figure 75). No provision of sanitary bins in schools is likely to affect girls' school attendance.

Figure 75 Availability of sanitary disposal bins in girls' latrines

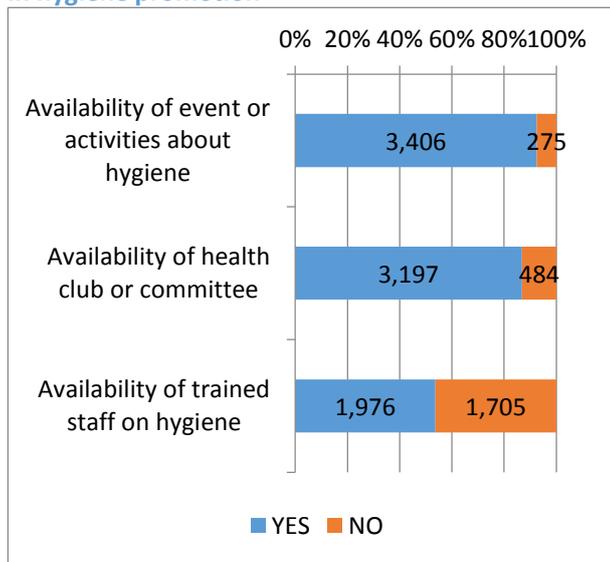

#### 4. Hygiene and Health

Hygiene promotion should be regularly conducted to remind students of the importance of hygiene as well as to promote children’s sustainable behavior change. Questions were asked relating to active involvement of schools in hygiene promotion, the frequency of hygiene promotion activities or events, the availability of trained staff on hygiene promotion, health clubs, management committees and soap at the latrine units.

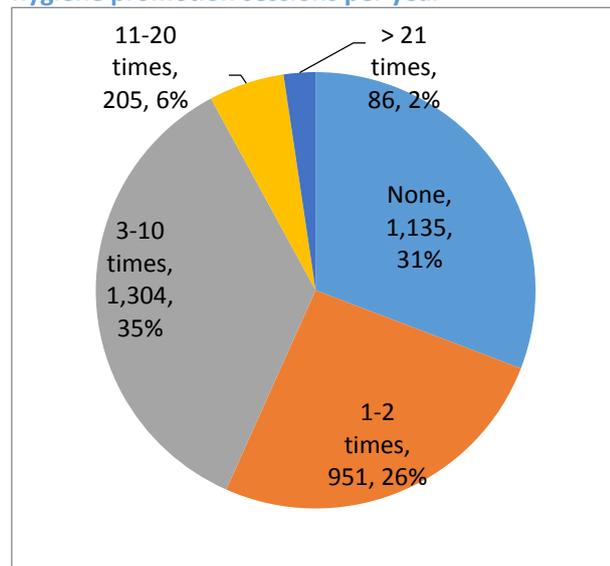

As shown in (Figure 76), 93% (3,406) of the schools had activities or events associated with hygiene and health. The most popular activities are extracurricular activities such as morning assemblies and “all-hands” events with students. In most of the Jordanian schools, assembly is held daily for 15 minutes twice a day. It is effective to continuously share hygiene-related topics with children on a daily basis. Hygiene activities or events for the students are provided by many actors as well as teachers, school health clubs and school management /health committees such as MoE , MoH, medical doctors from public health clinics and NGOs. Health clubs consisted of students, school management, health committees formed by teachers, parents and community members. 86.9% of the schools had either a health club or a school management/health committee. However, types of activities they do to promote hygiene might be different in schools and therefore, further assessment is required to identify the impact of these activities.

Despite the fact that activities or events are being organized in most of schools, only 54% of all schools have trained staff on hygiene promotion. In addition, hygiene promotion sessions have been provided in 69% of the schools only (Figure 77).

**Figure 76 Number of assessed schools: Participation in hygiene promotion**

**Figure 77 Number of assessed schools: Frequency of hygiene promotion sessions per year**

To increase the awareness of hygiene, the cost of provision of training to teachers on hygiene promotion is estimated as a follow.

**Cost estimation 12: Provision of training to teachers**

Priority	Criteria	Targeting Schools	# of staff to be trained	Total Cost JD
FIRST priority	- Both MoE-owned and rented/partially rented schools - No trained staff on hygiene promotion	1,705	17,050	852,500
TOTAL		1,705	17,050	852,500

Conditions of estimation:

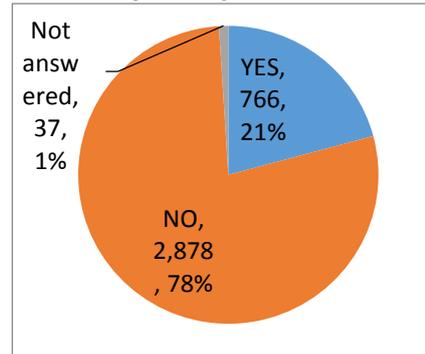

- ✓ # of staff to be trained per school: 10 teachers
- ✓ Hygiene training includes mobilization of school principals, one-day training of trainers (ToTs) to teachers, one-day hygiene session to students.
- ✓ Costs per school for hygiene training: 500 JD, 50 JD/staff member
- ✓ Costs includes allowance and transportation for public health specialist and hygiene materials for teachers.

79% of the schools have no soap at the latrine units (Figure 78), which would reduce the impact of hygiene promotion since children cannot practice behaviors they learn. Some schools claimed that they had no budgets for purchasing soap. Others stopped placing soap in school latrines because children played with it and lost it within a few days. Knowing the importance of using soap at critical times, some of the school principals suggested provision of liquid soap bottle which is fixed on a wall near the tap. In newly-built schools, wall-mounted liquid soap dispensers are available.

To improve the sanitary environment at school, estimated costs of provision of soap is as a follow.

**Cost estimation 13: Provision of soap**

**Figure 78 Number of assessed schools: Availability of soap in school latrines**

Priority	Criteria	Targeting Schools	Required QTY of soap	Total Cost JD
FIRST priority	- Both MoE-owned and rented/partially rented schools - No soap at latrines	2,878	7,526,880	612,204
TOTAL		2,878	7,526,880	612,204

Conditions of estimation:

- ✓ Costs per 80 g piece of soap : 0.082 JD
- ✓ # of required soap per month is calculated: (Total # of students in 2,878 schools X 50 g per person per month X 12 months) /80 g piece of soap

In 15% (548) of the schools, personal hygiene kits were distributed during the school year (Figure 79). Main providers of hygiene kits are NGOs. There are also cases that hygiene kits were provided by private companies, communities, schools and MoE/DoE. The distribution of hygiene kits, containing more than a piece of soap should make it easier for NGOs, health committees and teachers to draw the attention of children to their activities. However, taking into consideration the relatively high standard of living in Jordan, cost-effectiveness of programs and relatively low impact of hygiene kit distribution, aid organisations may consider ceasing distribution of hygiene kits.

In this assessment, some schools suggested a need for provision of hygiene sessions on menstruation for adolescent girl students. (Figure 80) shows that girls are not sufficiently provided with information on menstruation. Also, some school principals of boys’ schools requested for daily personal hygiene sessions for teenage boys.

Figure 79 Number of assessed schools: Hygiene kits distributed

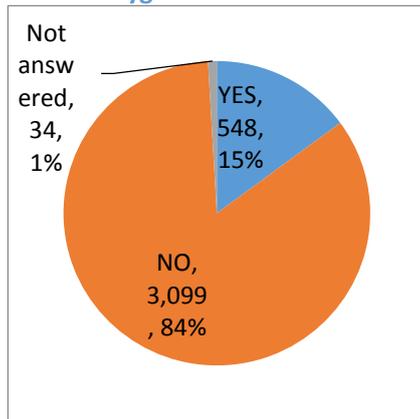

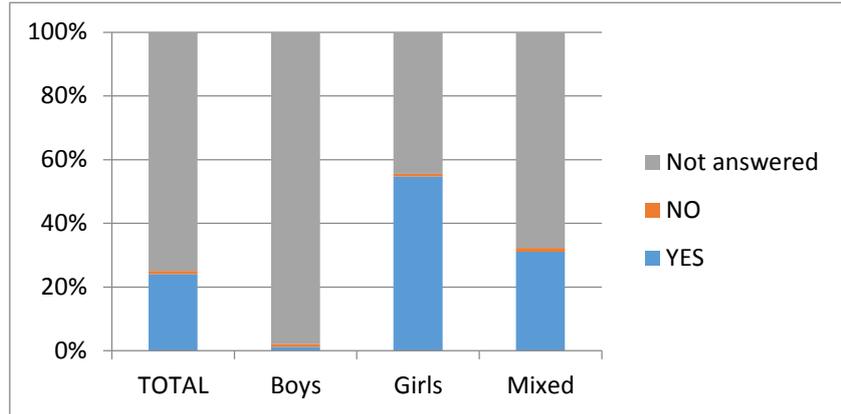

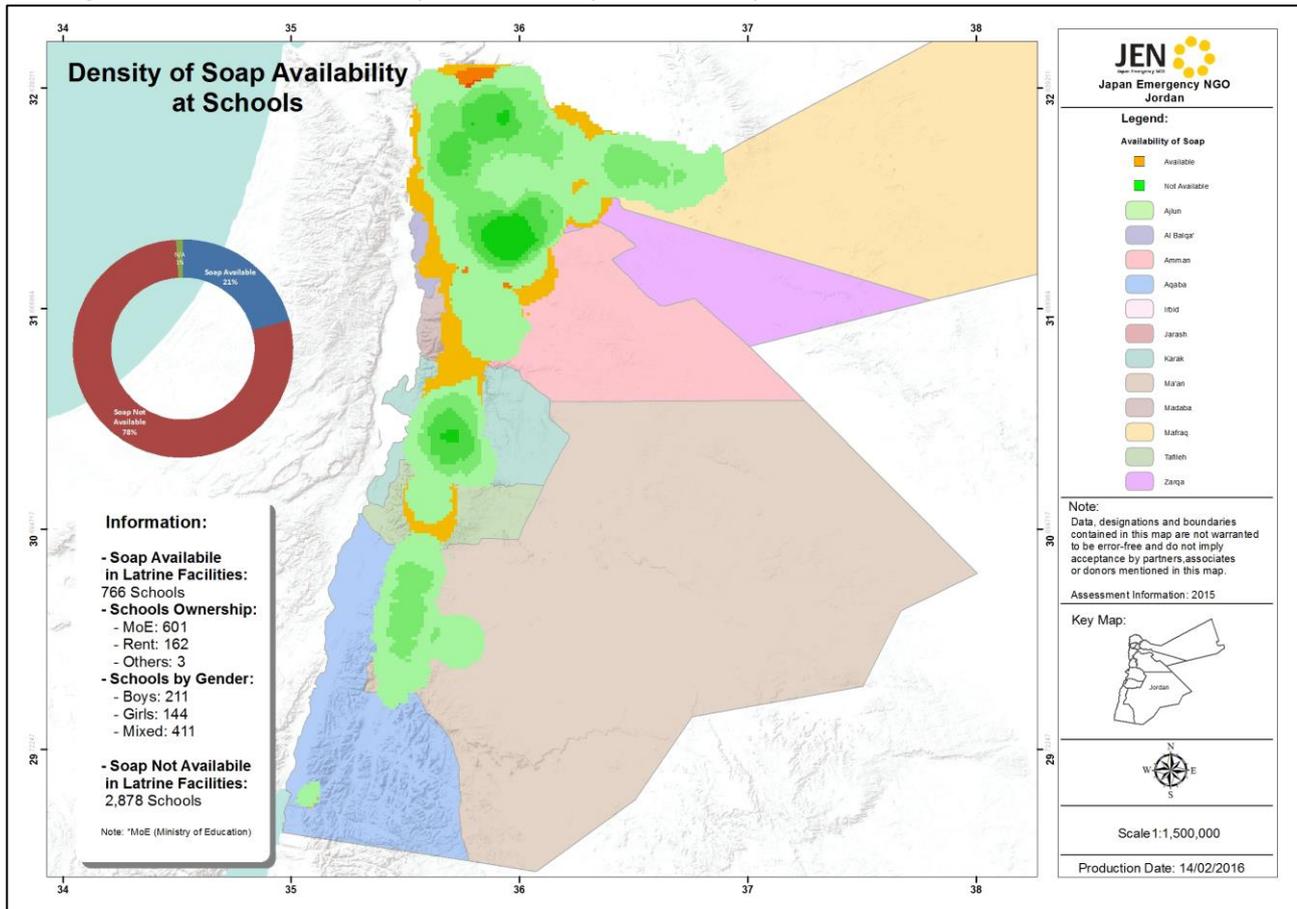

Figure 80 Education on physical changes during adolescence

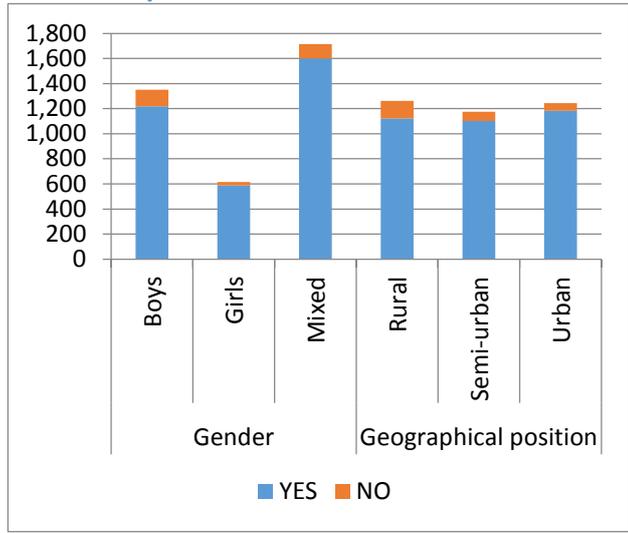

Overall, the following figures indicates a general trend that girls’ schools and schools in urban areas are more active in hygiene promotion and boys’ schools and schools in rural areas are less active. There is a possibility that hygiene is not considered as an important subject in rural communities. Increasing community awareness of hygiene might help improve their awareness by involving community members in hygiene-related events at school. In boys’ school JEN found difficulties conducting hygiene promotion at times due to children’s aggressive behaviors as well as to uncooperative teachers. Hygiene promotion training for teachers should be emphasized in boys’ schools in particular.

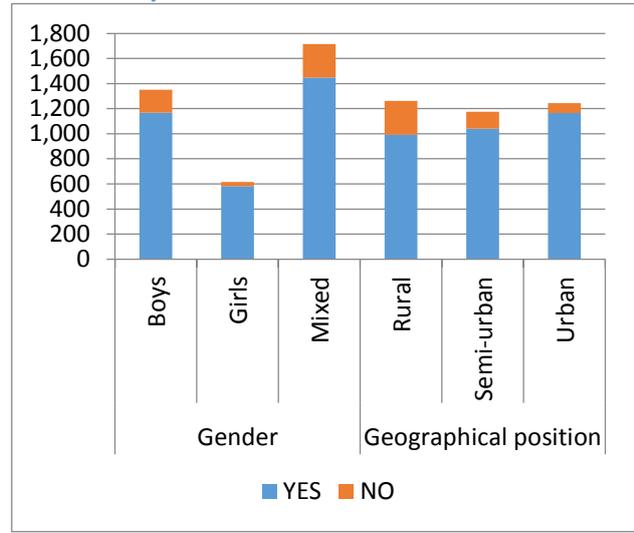

Map 9 Availability of soap

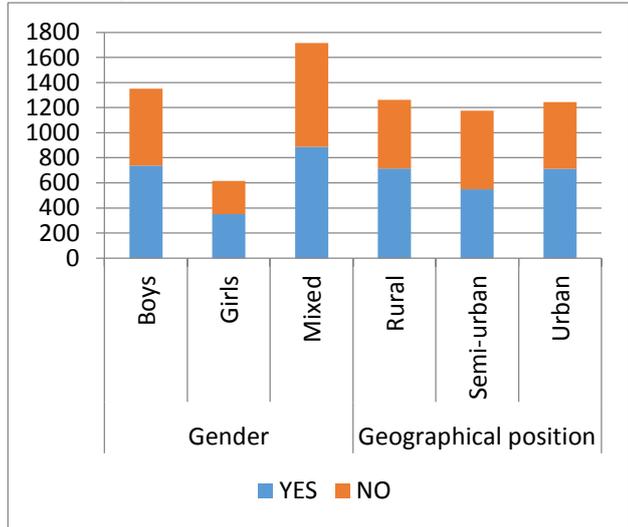

**Figure 81 Availability of hygiene events and activities in schools by characteristic features**

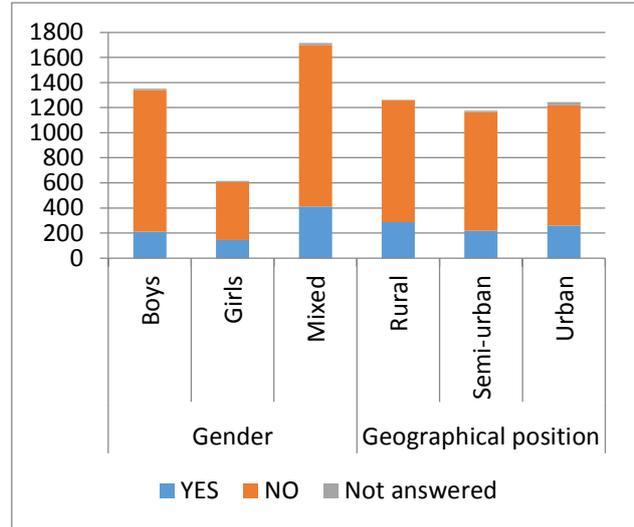

**Figure 82 Availability of health clubs and committees in schools by characteristic features**

**Figure 83 Availability of trained staff on hygiene in schools by characteristic features**

**Figure 84 Availability of soap in school latrines by characteristics features**

(Figure 85) shows that the relation between schools' active participation in hygiene promotion and the school latrine condition. Schools with latrines in good condition are more active in organizing hygiene activities or events, having soap available at latrine units and keeping a health club or school management/health committee active than those with latrines in bad condition. Providing that schools are actively involved in hygiene promotion, they tend to keep the school environment clean. Increasing hygiene awareness could also have contributed to the appropriate use and maintenance of school facilities.

Surprisingly, the availability of trained staff is inversely proportional to the condition of latrines. The percentage of schools which have trained staff members with latrines in poor condition is higher than those which have trained staff with latrines in good condition. The possible causes are that hygiene education training was not provided by applying appropriate methodologies to improve teachers' motivation or understanding on hygiene promotion or that participatory monitoring and evaluation was not appropriately conducted.

In the assessment JEN assessors asked school principals for the number of students who contracted hygiene related diseases in the last academic year. In response to these questions, 11% of all students were infected with diseases in the last academic year. 25% (902) of the schools responded that there were no students at all infected. As this seems unlikely there are doubts about the extent to which school principals pay attention to students' health condition or it is possible the question was not well understood. For accurate analysis, further assessment is required.

Figure 85 Hygiene promotion activities in schools and condition of schools latrines

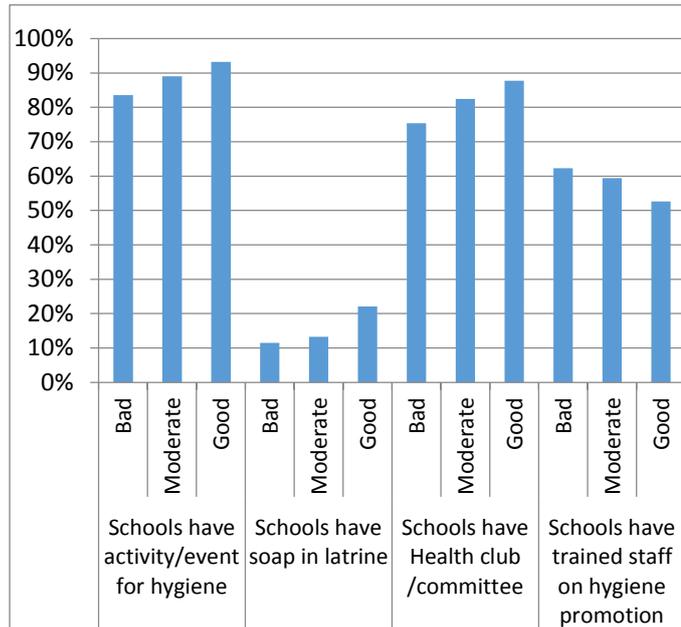

Figure 86 Number of students infected with diseases

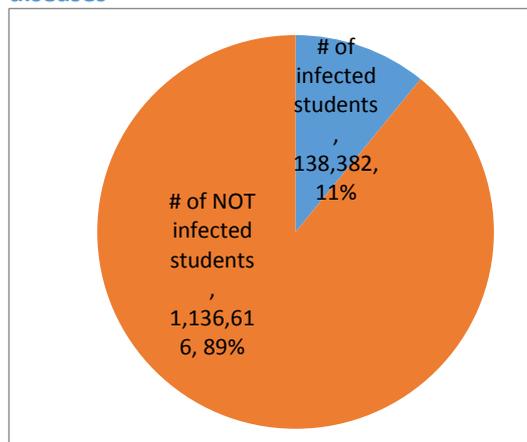

Figure 87 Number of assessed schools: Schools with students infected with diseases

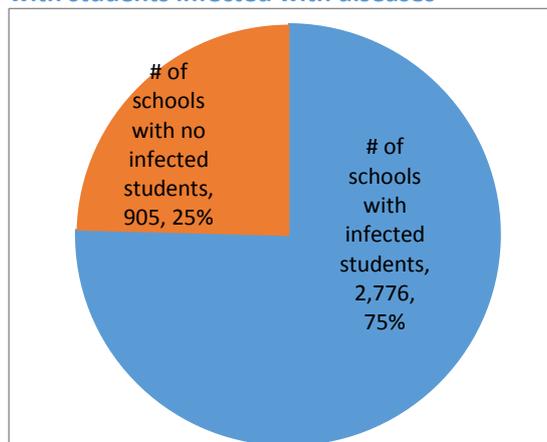

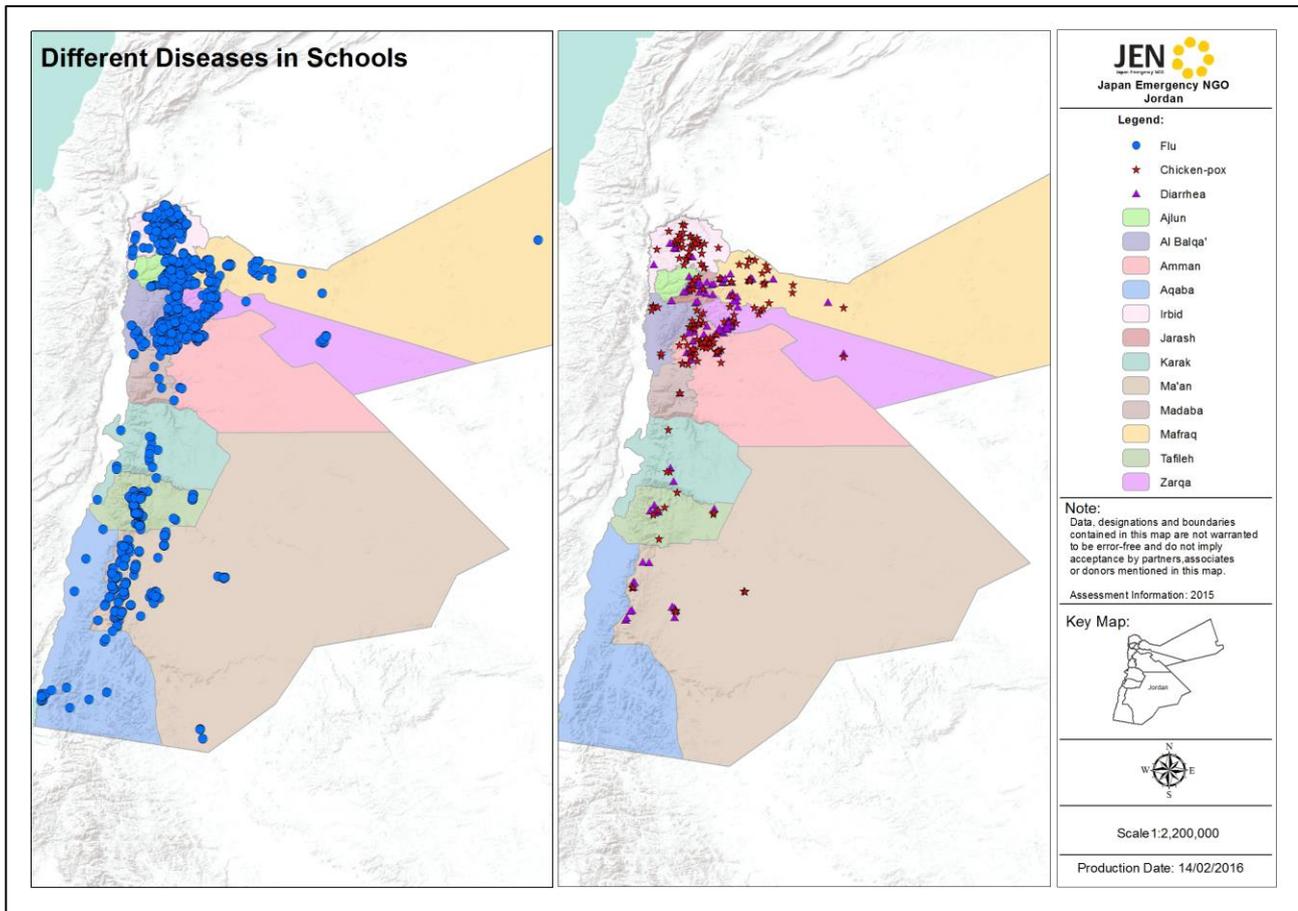

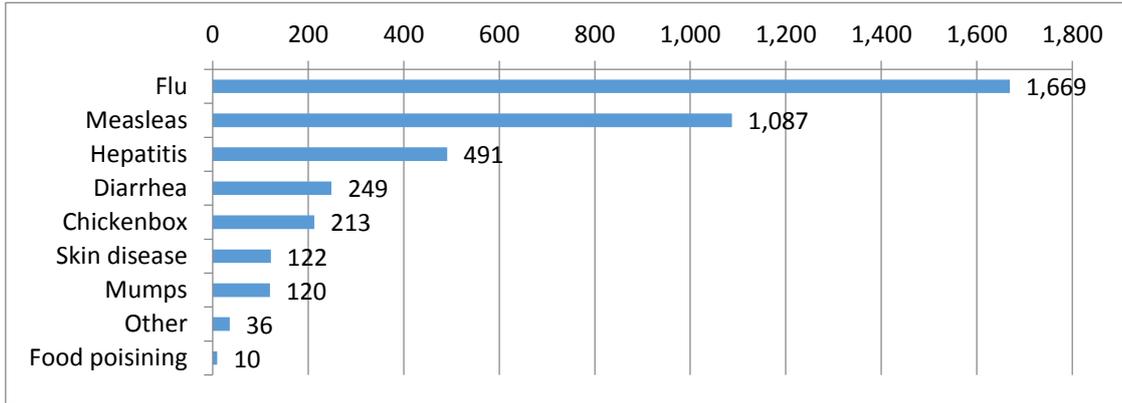

Figure 88 Infectious diseases in shcools

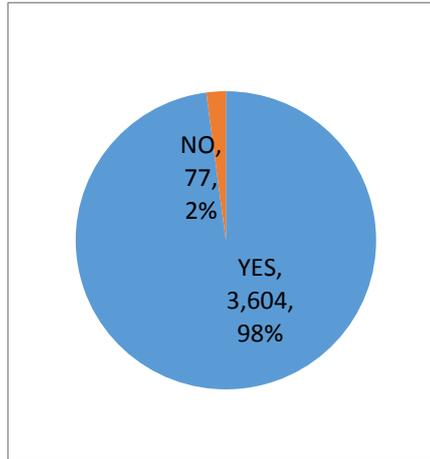

Map 10 Diseases related to hygiene

## 5. Parents and the Community

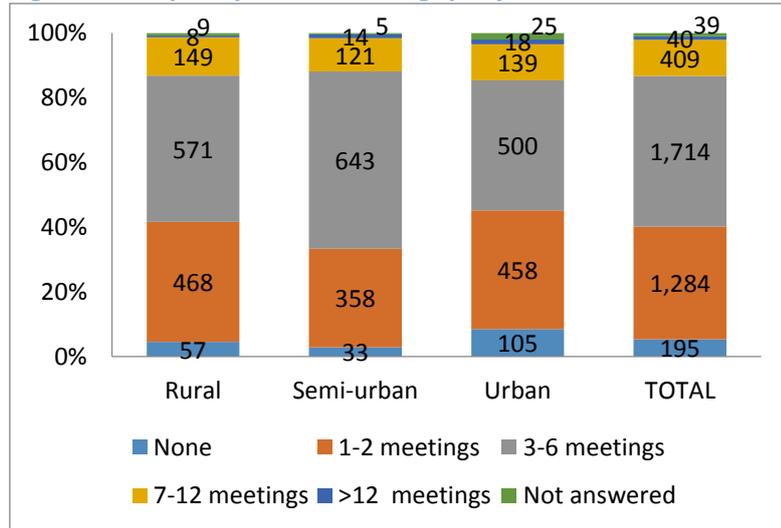

### PTA

In most of the schools (98%), a PTA has been established (Figure 89). However, the level and extent of activities varies in schools. As (Figure 90) shows, PTA meetings are held regularly in 94% of the schools. In the frequency of the meetings once a year or once per school term accounts for 35% and more than once per school term for 59%. The percentage of schools which do not hold regular meeting is slightly higher in urban schools, 105 schools. Out of them, 75% were in Amman.

**Figure 89 Number of assessed schools: Formation and presence of PTA**

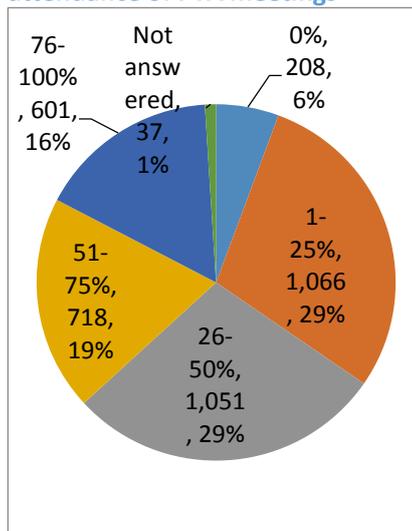

**Figure 90 Frequency of PTA meetings per year**

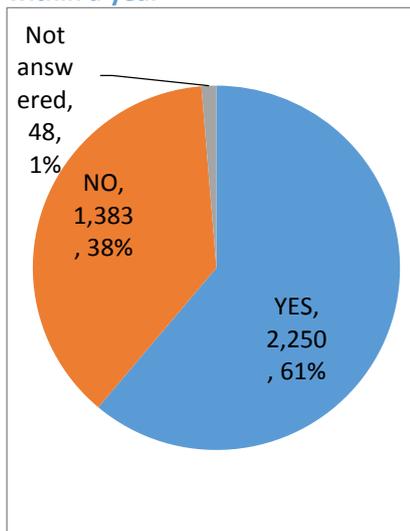

The number of parents attending PTA meetings was determined by interviewing the school principals. As the assessment did not include detailed parent attendance rates, the result might be affected by school principals' memories. However, it provided at least a brief overview of PTAs' commitment. In 57% of the schools less than a half of the parents participate PTA meeting, while in 36% more than a half of the parents participated (Figure 91).

61% of the schools had activities/events of any kind organized by PTA (Figure 92). Types of the events varied from national celebrations, promotional events for awareness of health, education, cleanliness etc., school bazaars, to meetings for discussing affairs of students and the school. It was expected that basic schools and parents are more active in this regard. The proportion of schools by educational level, however, showed PTA events is nearly the same rate at 62% in basic schools and at 60% in secondary schools (Figure 93).

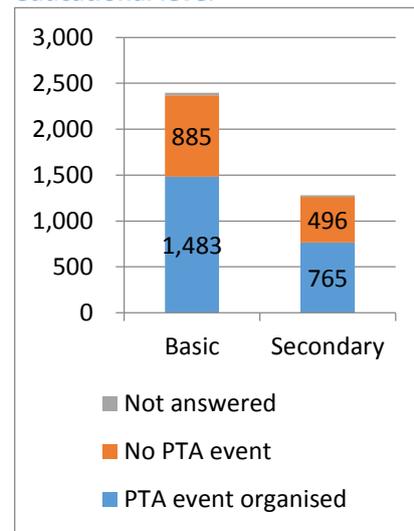

**Figure 91 Percentage of parents attendance of PTA meetings**

**Figure 92 PTA-organized events within a year**

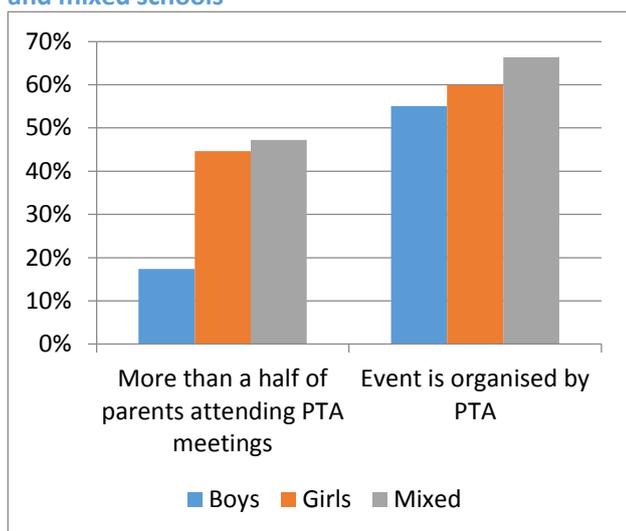

**Figure 93 PTA-organized events by educational level**

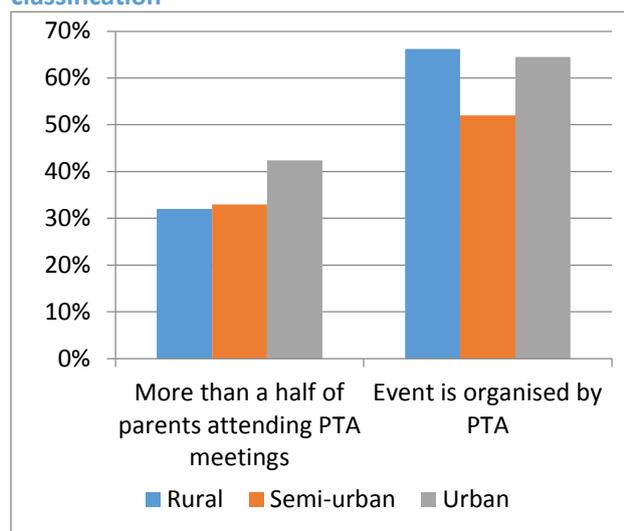

When looking into differences between single-gender schools and mixed schools in (Figure 94), PTA commitment and participation is weakest in boys' schools. It is assumed that boys' parents pay less attention to the learning environment compared with girls' parents. Active involvement of PTA in mixed schools could be explained by the large portion of female students in mixed schools.

By geographical classification as shown in (Figure 95), in rural areas there is a big gap in interests of parents between attending a PTA meeting compared to organizing events with the PTA. Parents in these areas seem to be less interested in attending PTA meetings, whereas they are eager to organize events. Given that school events are considered as part of community events in rural areas, schools may be a good platform for community mobilization in rural areas.

**Figure 94 Active participation of PTA in single-gender and mixed schools**

**Figure 95 Active participation of PTA by geographical classification**

To improve PTA involvement, costs of holding a regular hygiene-related event at school is estimated as follows. Other types of participation and contribution by community are also required.

Cost estimation 14: Allowance for organizing events and activities

Priority	Criteria	Targeting Schools	Total Cost JD
FIRST priority	- Both MoE-owned and rented/partially rented schools - PTA have organized no events within one year	1,383	553,200
TOTAL		1,383	553,200

Condition of estimation:

- ✓ Costs per event: JD 200
- ✓ Frequency of events: 2 times a year

Communities

27% of the schools have received support or contribution from communities (Figure 96). As (Figure 97) indicates, types of community contributions vary with in-kind and financial donations being more popular. Donation of cash or non-cash items would be helpful for school operation. However, this kind of contribution seldom creates a community-school partnership and generates collective power for community participation. It is recommended that schools work together to drive the implementation of community participation in activities forward such as daily cleaning and routine maintenance of school facilities for a healthy school environment. As it was seen in the same as PTA involvement, boys' schools and schools in rural areas receive less contribution from communities.

Figure 96 Number of assessed schools: Community contributions to schools

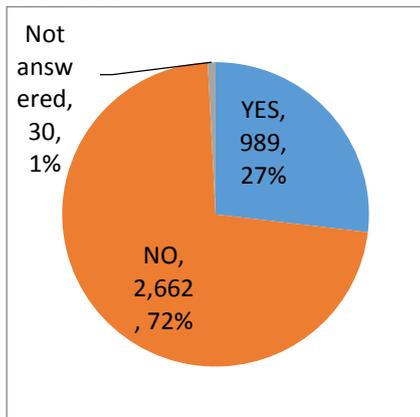

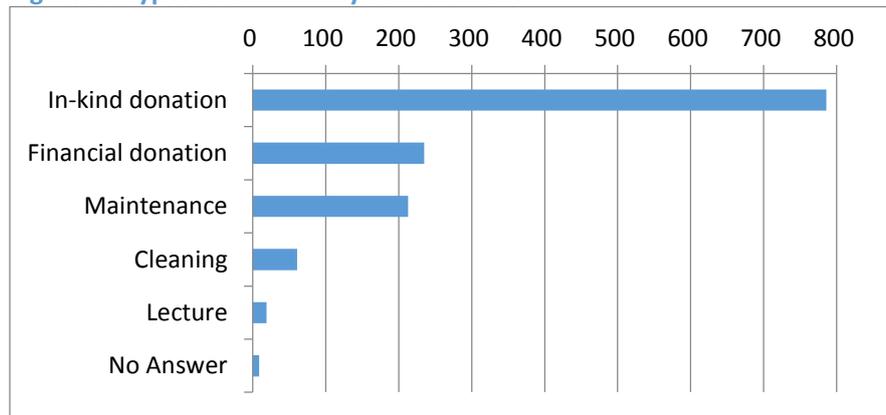

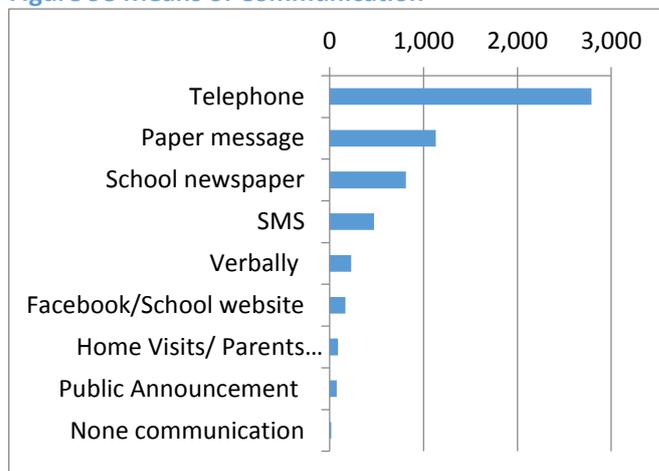

Figure 97 Types of community contributions

A strong partnership between schools and families should be established. The effective school-home communication can help not only to deal with emergency cases but also to encourage parents to be involved in their children's learning and schooling. Through various technology-enabled initiatives, contact can be established with parents.

According to (Figure 98), telephone is the most common way for schools to contact parents at 76%. It is useful merely to convey messages quickly and

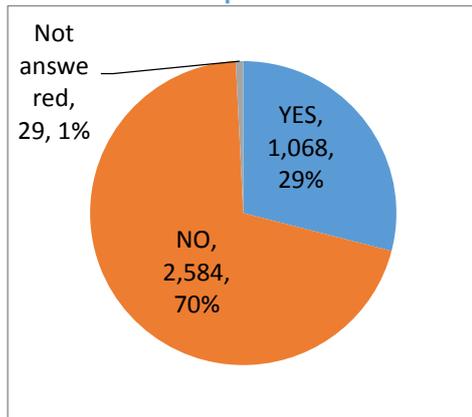

Figure 98 Means of Communication

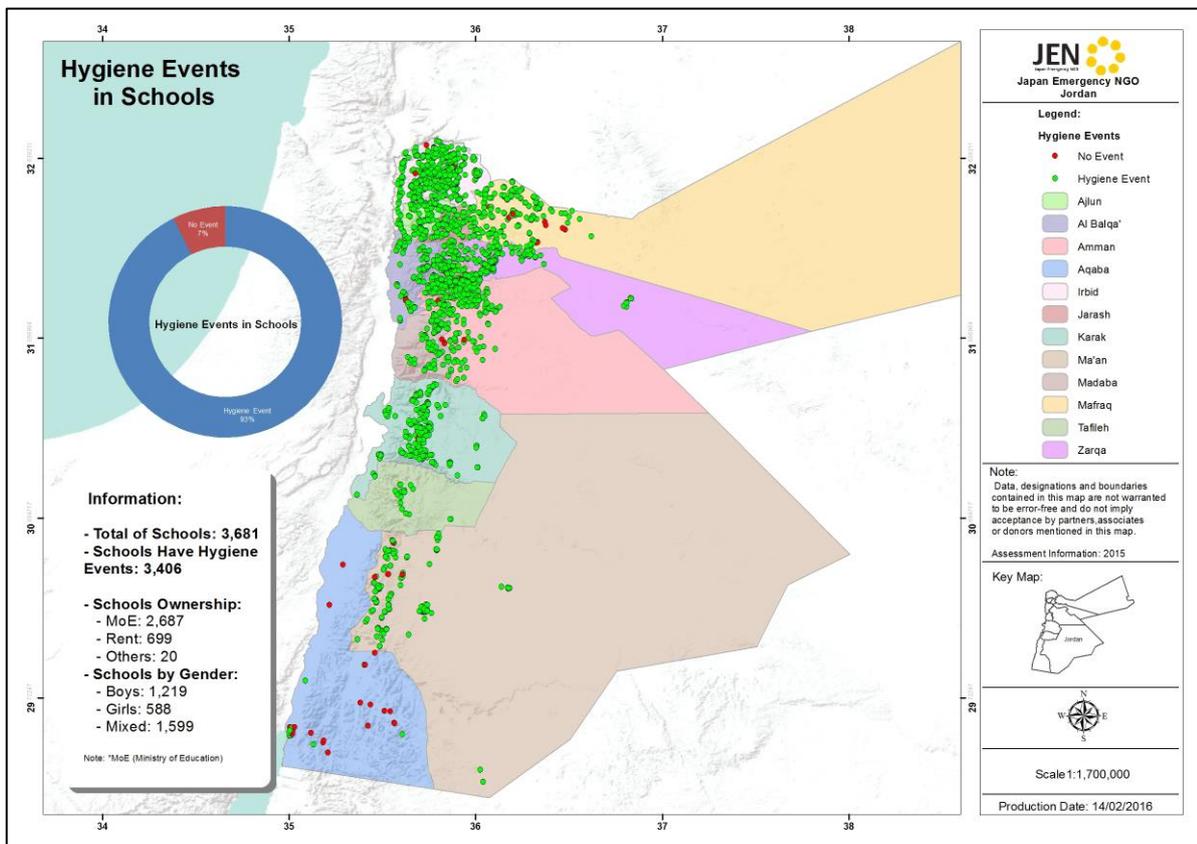

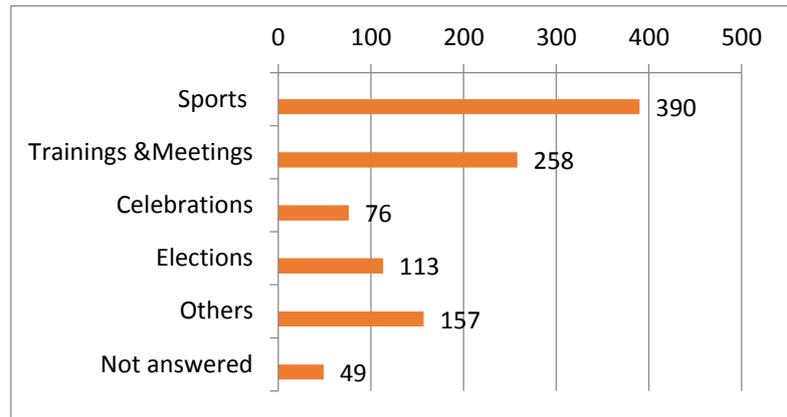

successfully as telephone communication is two-way. Newsletters enable educators and children to share children's experience, good practices and pleasant episodes in schools with families. School newsletters have been introduced in 22% of the schools.

Facilities of around one third of the schools are used for non-school activities such as sports, training, meetings, celebrations and elections in non-school hours (Figure 99) and (Figure 100). Schools traditionally have been the centers of their communities. Encouraging the community use of school premises would enable schools and communities to educate children together and also bring a sense of ownership among communities. Proper guidelines for the use of the facilities should be provided.

**Figure 99 Number of assessed schools: Non-school use of public school facilities**

**Figure 100 Number of schools and purpose of facilities usage in non -school hours**

**Map 11 Hygiene events in schools**

## 6. Teachers

A student-school staff ratio by country as (Figure 101) shows. Jordan’s ratio compares favorably with that of Japan and other Middle East countries as well. Although the number of school staff per school was assessed, the school staff includes not only teachers but support staff such as administrators, cleaners and guards. Therefore, the assessment results do not show an exact student-teacher ratio.

There are comparisons of the ratio by characteristic features. Due to population density in urban areas, the student-school staff ratio in schools in urban areas is high, 14.5 students per staff (Figure 102).

Figure 101 Student – school staff ratio by country

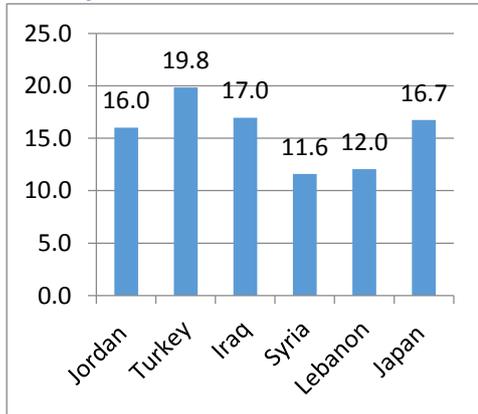

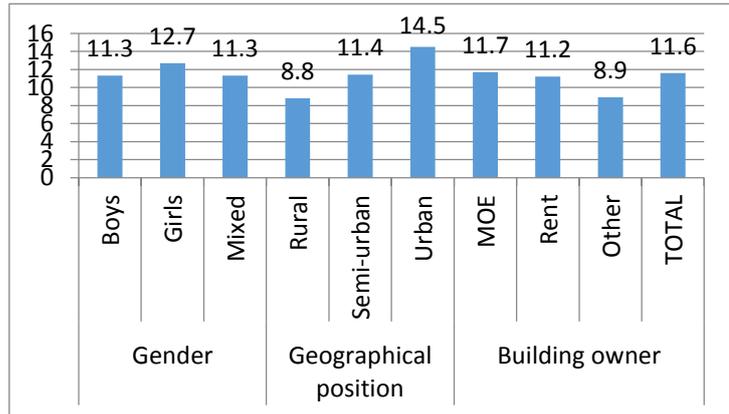

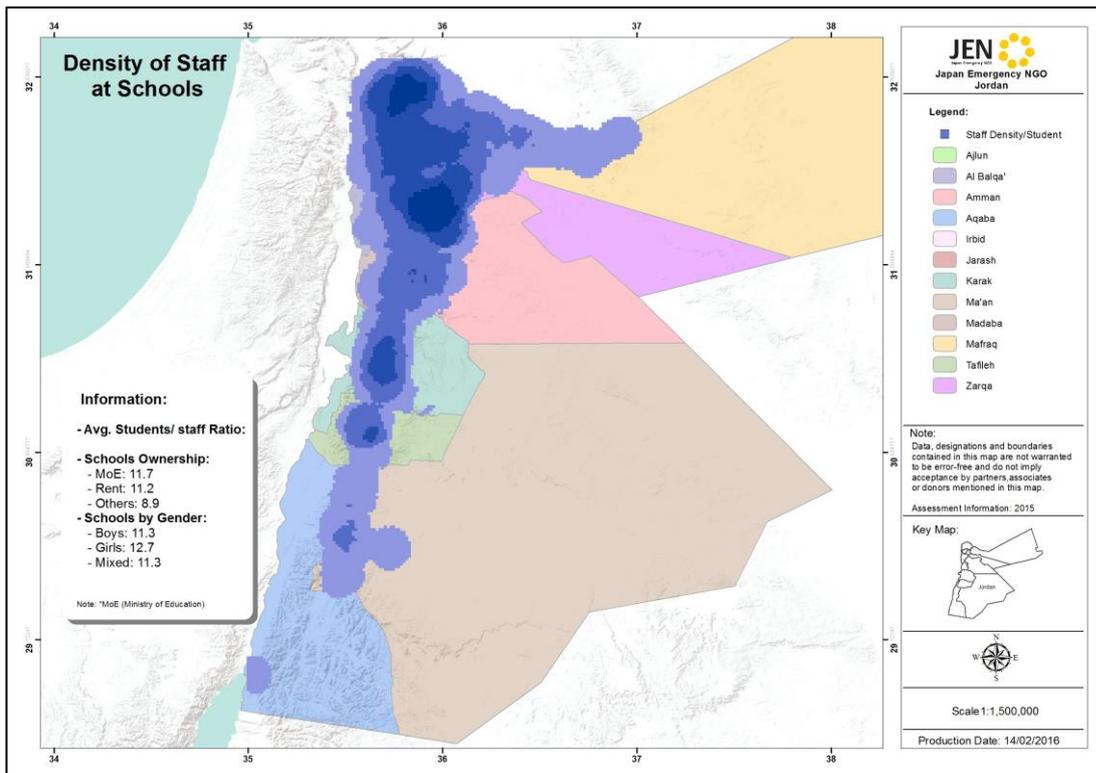

Figure 102 Average student-school staff ratio by characteristic features

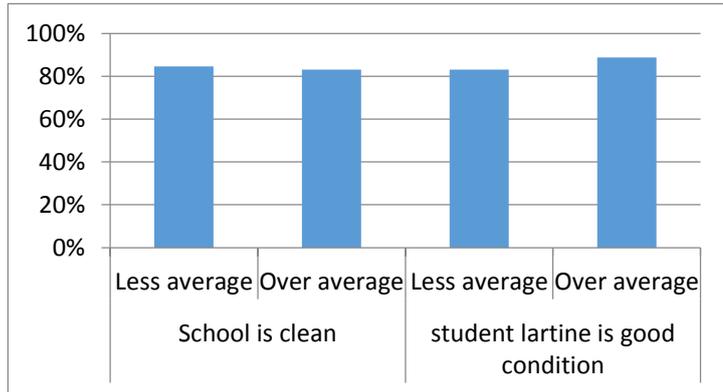

The ratio of students to school-staff indicates how resources for education are allocated and will affect the quality of education. As the topic of quality of education was not covered in the assessment, the relationship between the student to school-staff ratio and a school learning environment was not analyzed. It is assumed that creating or keeping an appropriate leaning environment such as cleanliness in schools and the condition of latrines is not affected by the ratio. (Figure 103).

Teacher training has been provided in most of the schools (94%), mainly by the MoE. The common type of training is on teaching methods, which 87% of the schools have received.

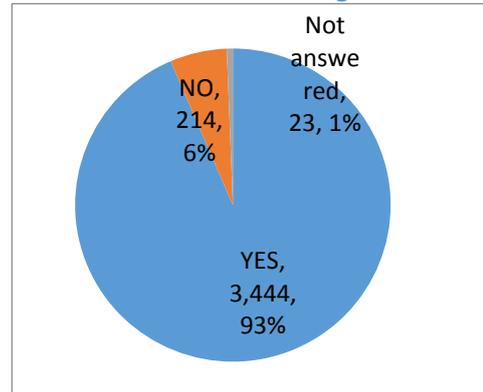

Map 12 Teachers density by schools

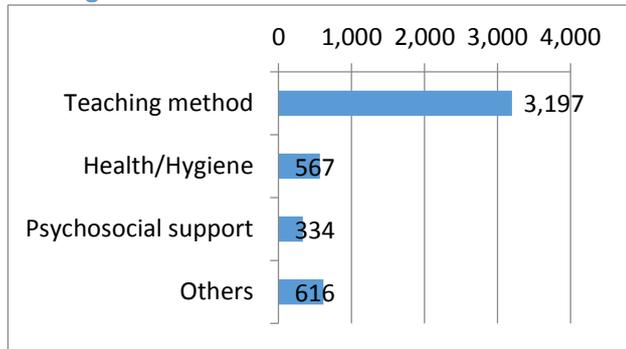

**Figure 103 Schools facilities condition and per student-school staff ratio**

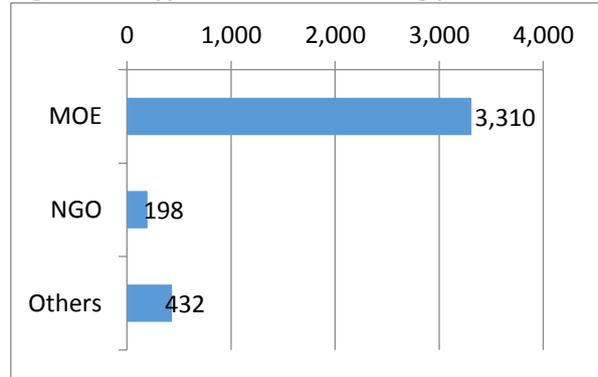

**Figure 104 Number of assessed schools: Poviosion of teacher training**

**Figure 105 Number of assessed schools: Types of teacher training**

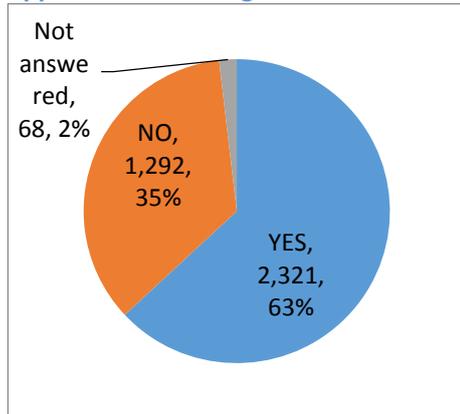

**Figure 106 Types of teacher training providers**

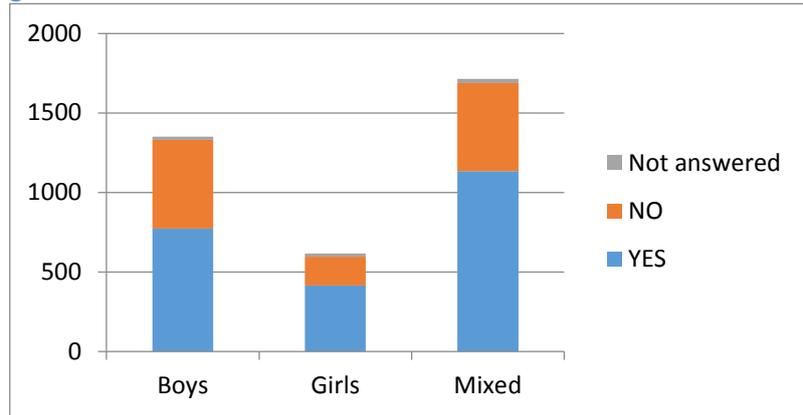

Information sharing and peer education among teaching staff may encourage teachers to improve school learning environments or to collaborate on schools affairs, academic affairs and students affairs. 63% of the schools indicated that they have an opportunity to exchange ideas or experience with teachers from other schools (Figure 107). As (Figure 109) indicates, the best opportunities for interpersonal interactions are created at MoE organized meetings and teacher association meetings.

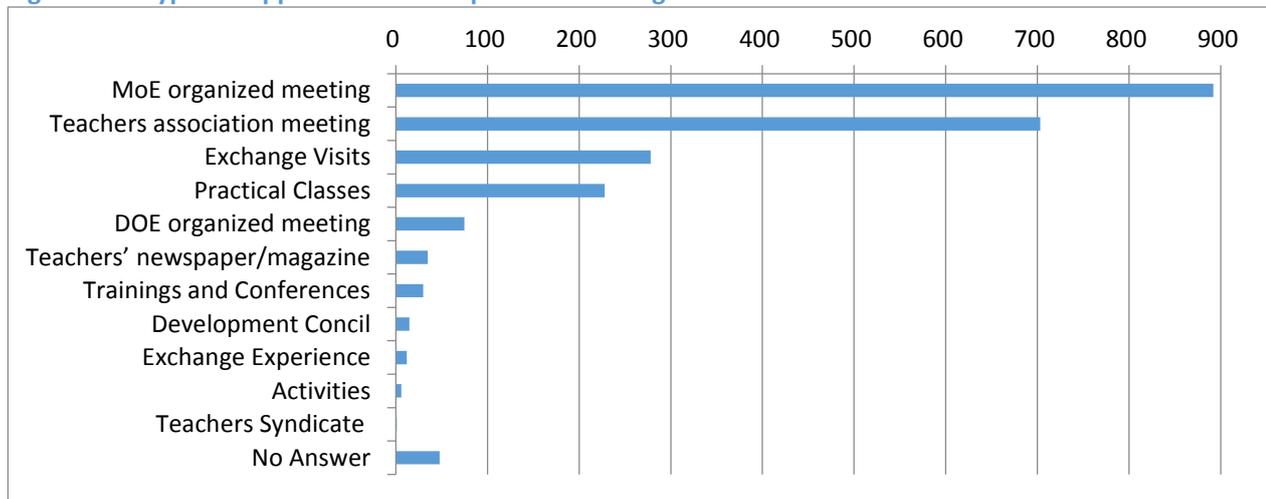

**Figure 107 Number of assessed schools: Experience-sharing opportunities among teachers**

**Figure 108 Experience sharing opportunities among teachers and gender**

**Figure 109 Types of opportunities of experience-sharing**

An Facebook profile was created for WASH-in-School activities<sup>9</sup> in Jordan to introduce our activities on rehabilitation, expansion and construction of WASH facilities and hygiene promotion activities in schools. This also allows JEN to interact with these schools and to widely share their good practices, transformation and difficulties and to monitor school hygiene promotion activities. Therefore, it is made available to the public.

<sup>9</sup> <https://www.facebook.com/pages/%D9%85%D9%86%D8%B8%D9%85%D8%A9-%D8%B7%D9%88%D8%A7%D8%B1%D8%A6-%D8%A7%D9%84%D9%8A%D8%A7%D8%A8%D8%A7%D9%86-JEN-Jordan-Hygiene-Promotion-Activities/441061676015627>

## 7. Child Protection

### Children with special needs

In this assessment, the definition of “children with special needs” is limited to those who have physical constraints and are hindered from using the school latrines. On that account, it was found that the number of students with special needs was very low, 1,601 or 0.1% of the total number of students. They are scattered in 746 (20%) of the schools. Some Jordanian schools have special classes for children with hearing and visual impairments. However, this figure does not include them. For developing a situation analysis on children with special needs, further and more detailed research will be required.

Support for children with special needs is provided only in 9.5% of the schools. Of the 746 schools which accommodate children with special needs, special support is available only in 28% (Figure 110). Most common type of assistance available and provided for these children was counseling (Figure 111) and (Figure 112).

Education specialists, or special education teachers who are licensed to teach special needs children in a public school, are available in 2,065 (56%) schools (Figure 113). Compared to the number of special support teacher schools, the coverage of education specialist is higher. It is high especially in schools in urban areas since the number of children with special needs concentrates in those areas.

Figure 110 Number of assessed schools: Provision of special support

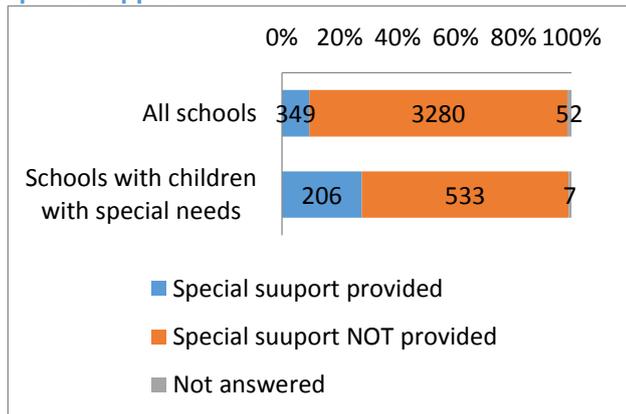

Figure 111 Types of special support

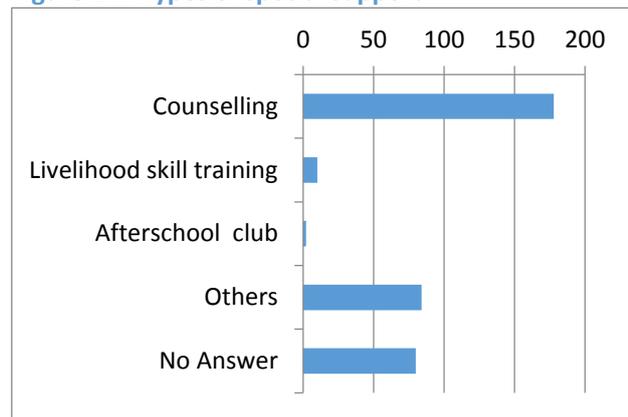

Figure 112 Providers of special support

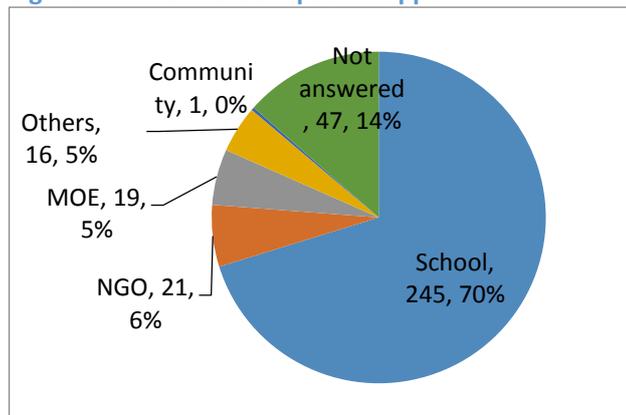

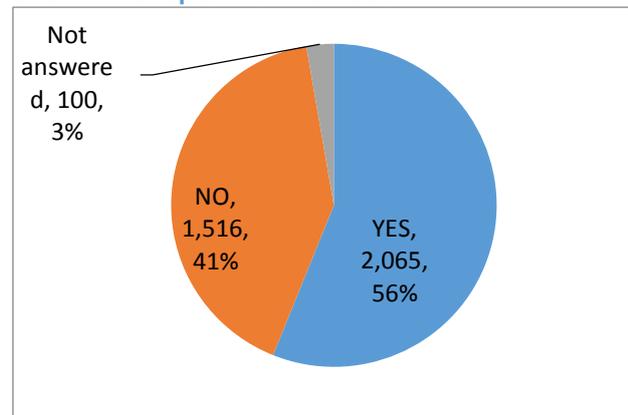

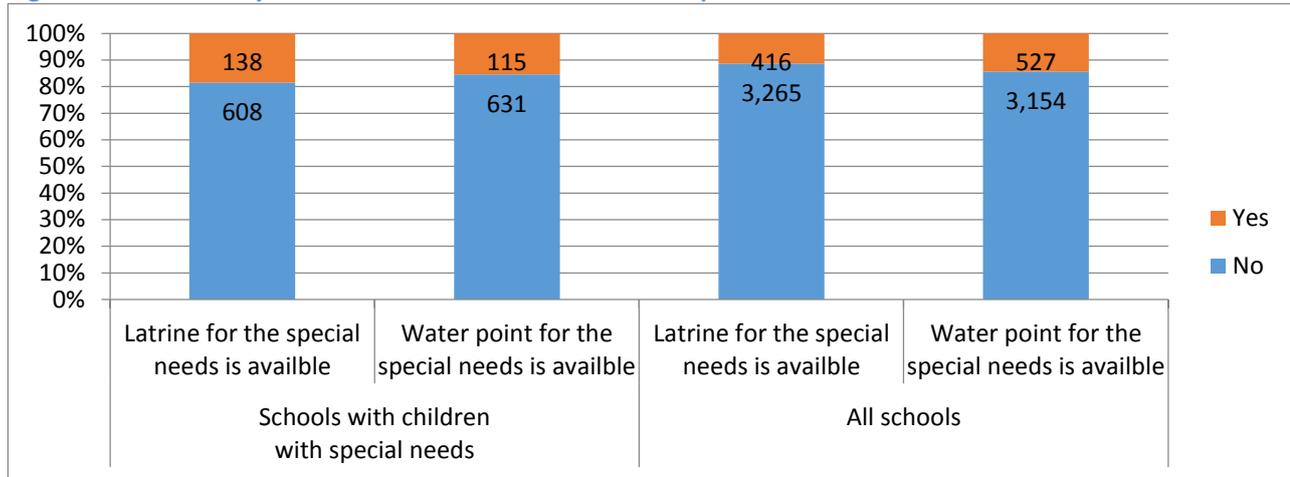

Figure 113 Number of assessed schools: Availability of education specialist in schools

The availability of accessible WASH facilities for children with special needs in schools was observed by the JEN surveyors. 11% of the schools had latrines adapted to help children who need assistance and 14% had water points for those children. Among the 746 schools where there are children with special needs, only 15 and 18% of them have latrines and water points designed for those children.

Figure 114 Availability of WASH facilities for children with special needs

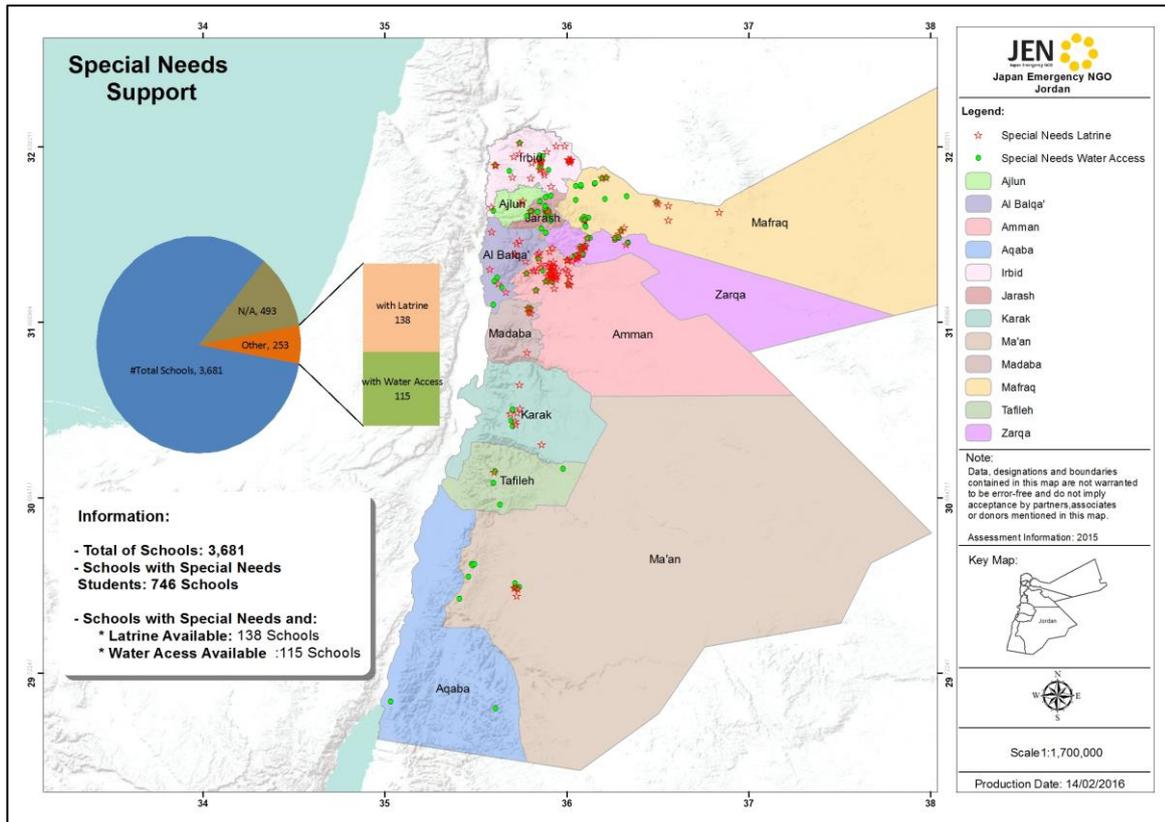

To help improve access to latrines for children with special needs, costs of upgrading one cubicle to a western latrine seat are as follows.

Cost estimation 15: Upgrade of latrines for children with special needs

Priority	Criteria	Targeting Schools	Total Cost JD
FIRST priority	- Both MoE-owned and rented/partially rented schools - There are children with special needs - No latrines ad special needs	608	194,560
SECOND priority	- Both MoE-owned and rented/partially rented schools - No children with special needs - No latrines adapted for special needs	2,657	850,240
TOTAL		3,265	1,044,800

Conditions of estimation:

- ✓ Costs per cubicle: JD 320
- ✓ Work includes: Removal of the old eastern latrine seat, installation of a new western latrine seat with a flushing system and overflow, chrome operating handle, chrome water lock, water shower, arm rail, and door etc.

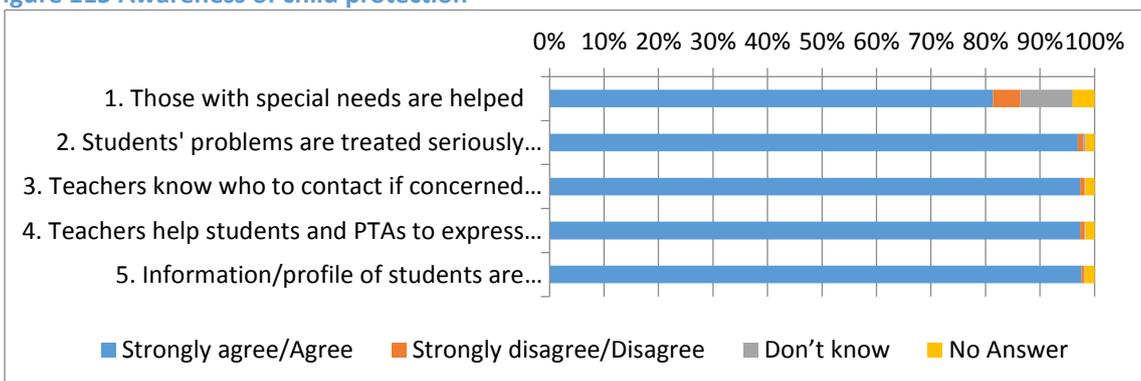

Map 13 Special needs students in schools

### Awareness of Child Protection

To learn the level of awareness regarding child protection issues in schools, five opinion-based survey questions (Figure 115) were presented to school principals and they were asked to what extent they agree with them. These questions were answered from the perspective of the school principals and sources of evidence to answer the questions were unidentified.

Most (97%) of the school principals who responded strongly agree/agree that ‘Students’ problems are treated seriously and respectfully’, ‘Teachers know who to contact if concerned for a student’s matter’, ‘Teachers help students and PTAs to express their views’ and ‘Information/profile of students are available and updated to be used in emergencies’. However, regarding the question ‘Those with special needs are helped’, school principals who agreed to it dropped to 81%. Around 10% of the respondents answered that they did not know. The awareness of providing support for children with special needs may be raised and widely shared among school principals.

Figure 115 Awareness of child protection

### Students Transportation

The assessment found out how far and with what means of transportation students in Jordan commute to school. Questions were answered by school principals, not by all students and therefore, the assessment results might not be completely accurate. It gives an overview of children’s school commuting situation in Jordan.

If students live out of commuting distance, they may encounter difficulty attending classes, which are easily accessible for local students. Long commutes to school for children could have an impact on access to education and also have an impact on the lives of the families financially and socially.

As (Figure 116) and (Figure 117) show, the main transportation means for students are on foot at 72% and by school bus at 18%. Girls’ schools have a higher tendency to use school buses or private cars, probably for reasons of safety and cultural and social norms rather than a long distance to school. In schools in rural areas, the proportion of students travelling to school on foot is higher than in schools in other geographical areas. In Jordan fees for school bus transportation in public schools are paid by the parents of children, not by schools or the government. If the cost becomes a financial burden for families, there will be a lower demand for school bus services.

Approximately 60% of students live 3km or less from school and 75% live 5 km or less from school. Students attending rural and semi-urban tent to live slightly further from their school.

Figure 116 Average percentage: Transportation of students to schools by characteristic features

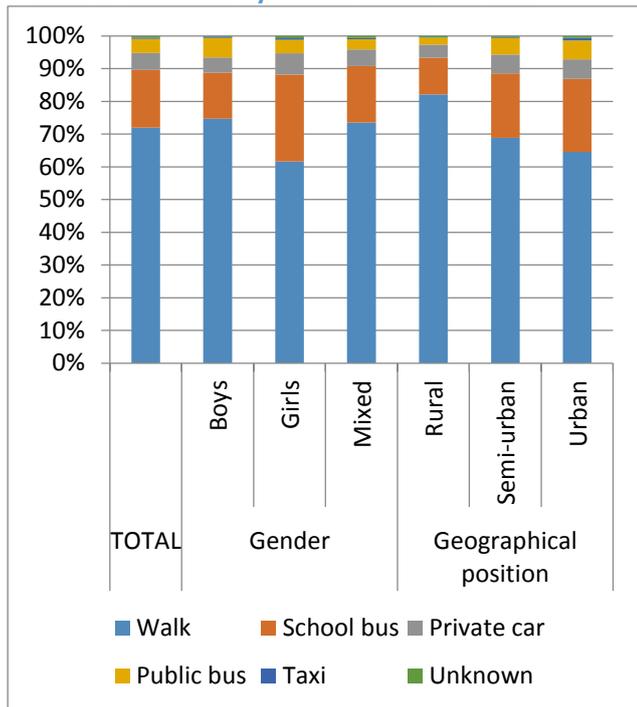

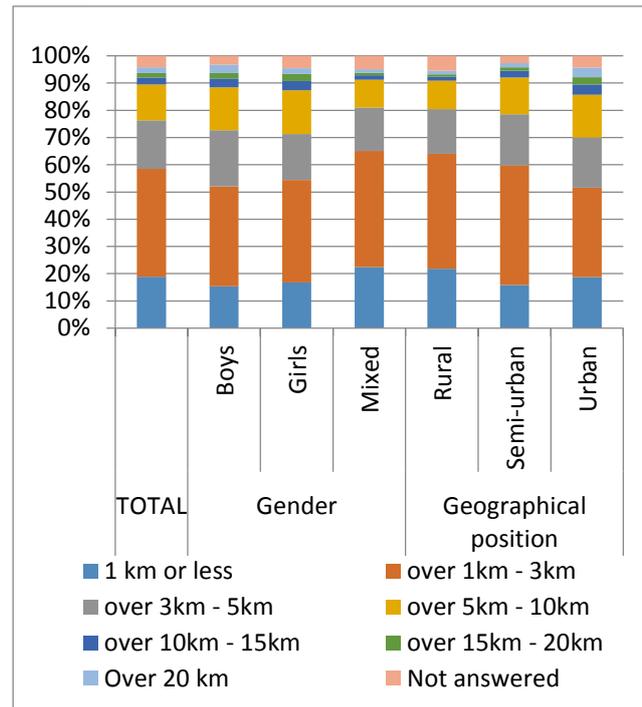

Figure 117 Farthest distance from school to students’ house

### 8. NGO Involvement

NGOs have made significant contributions to assist schools in Jordan, especially those affected by the Syrian crisis which began in 2011. During the assessment period, NGOs were actively working or planning activities in 37% of the schools. (Figure 118). Due to a larger influx of Syrian refugees, Irbid, Amman and Mafrq governorates received more support from NGOs (Figure 120). Looking into the situation by gender, about half of all girls' schools have drawn attention from NGOs. However, by raw numbers, more boys' and mixed schools have received attention from NGOs. MoE-owned schools received more assistance from NGOs than rented schools. .

Figure 118 Number of assessed schools: Provision of assistance to shcools from NGOs

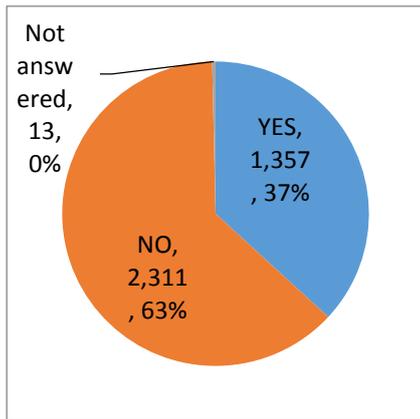

Figure 119 Provision of assistance to shcools from NGOs by characteristic features

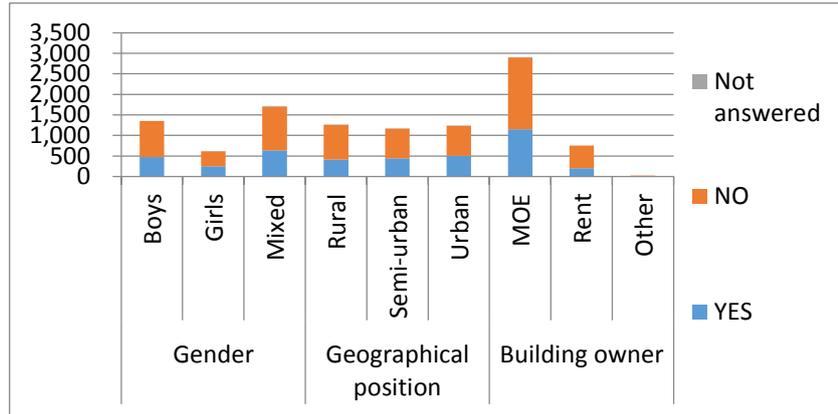

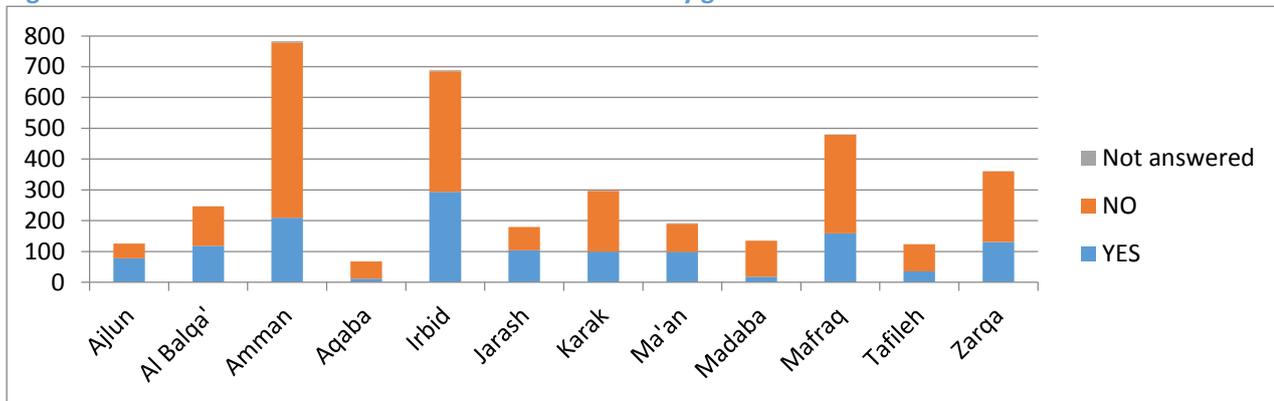

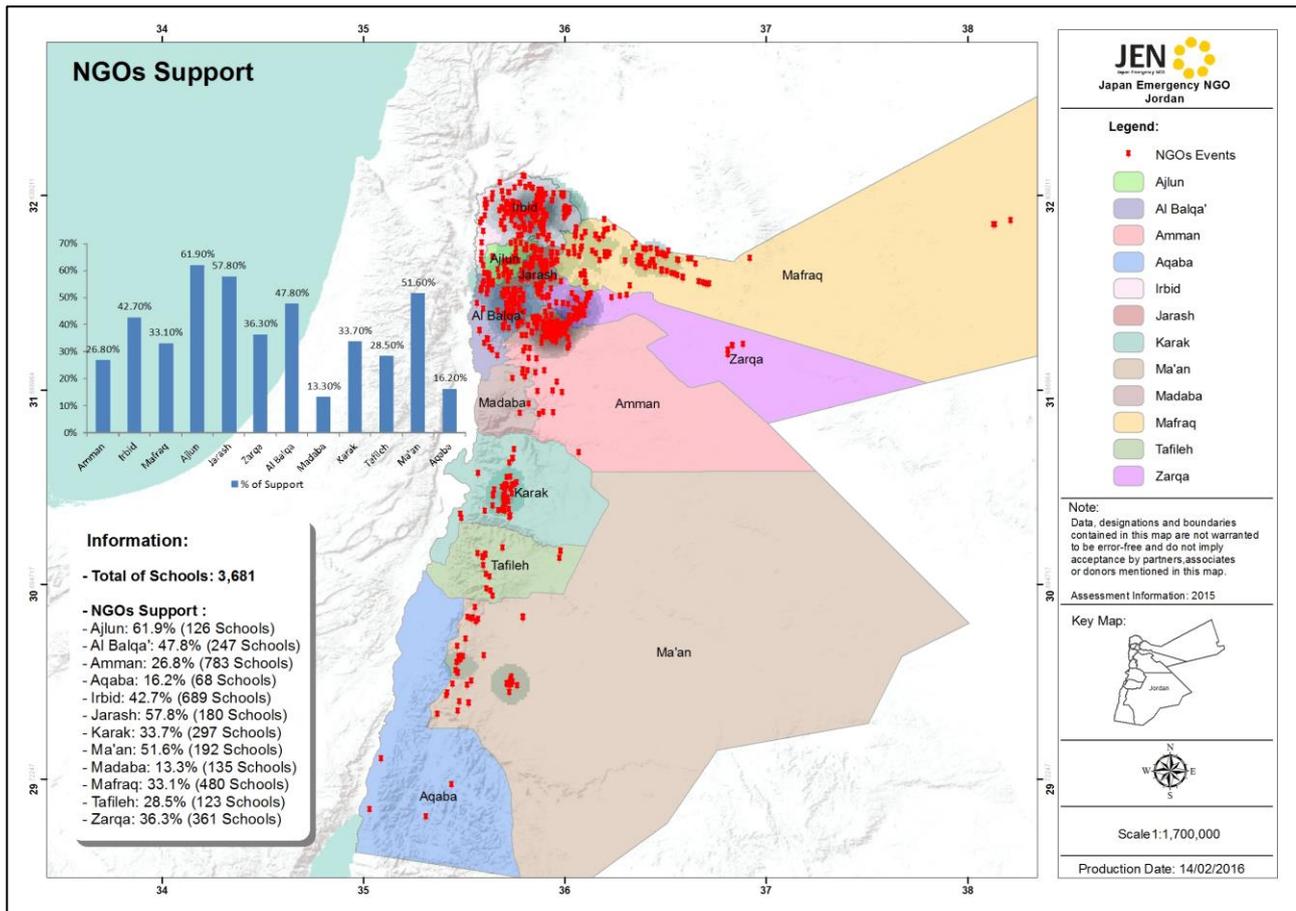

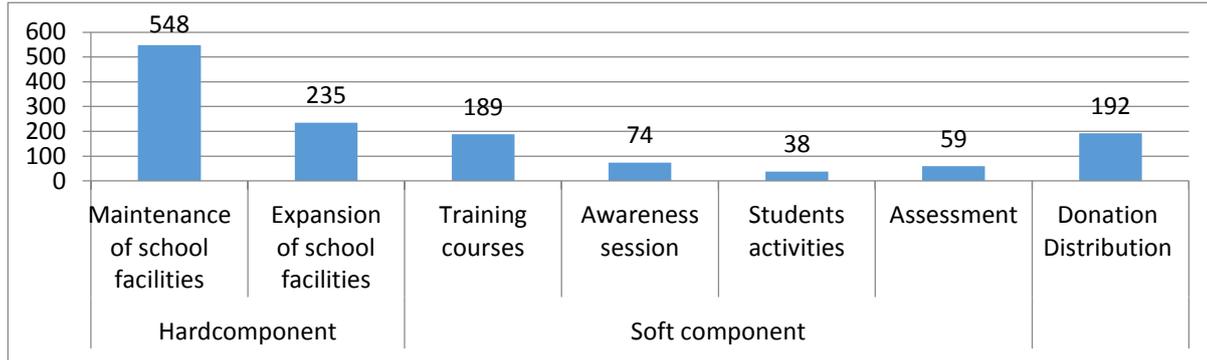

Figure 120 Provision of assistance to shcools from NGOs by governorate

Types of support provided by NGOs was divided into three categories; hardware components including expansion or maintenance of school facilities (58% of assisted schools), software components including teacher training etc. in (41% of assisted schools) and donation/distribution in 33%.

Figure 121 Types of assistance from NGOs

Map 14 NGOs involvement

## IV. CONCLUSION AND RECOMMENDATIONS

### Total Costs Estimated

The following table represents the total estimated costs for improvement of a school environment in reference to each cost estimated in the previous sections. Priorities were set in ways that promote cost based on cost-effectiveness.

Category	Work	Target	# of targeting schools	Cost (JD)	
Classroom	Classroom expansion	MoE-owned schools	1,265	51,775,000	
	New school construction	MoE-owned schools	142	201,072,000	
Safe school Environment	Construction of a protection wall	MoE-owned schools	306	15,300,000	
Playground	Construction of a playground	MoE-owned schools	754	67,860,000	
Hardware Components	Latrine	Rehabilitation of unusable/ broken/ damaged latrine seats	MoE-owned and Rented schools	1030	2,913,750
		Construction of additional latrine facilities	MoE-owned schools	516	6,359,100
		Installation of a partition	MoE-owned and Rented schools	1,040	691,600
Water	Connection to a public water network	MoE-owned schools	62	434,000	
	Installation of additional water tanks	MoE-owned and Rented schools	1,471	1,711,683	
Waste Water	Connection to a public sewage network	MoE-owned schools	2003	21,031,500	
Solid Waste	Provision of waste disposal containers	MoE-owned and Rented schools	2,698	2,134,210	
Software Components	Hygiene and Health	Provision of soap	MoE-owned and Rented schools	2,878	612,204
		Provision of training to teachers	MoE-owned and Rented schools	1,705	852,500
	Parents and the Communities	Allowance for organizing events/activities	MoE-owned and Rented schools	1,383	553,200
	Child Protection	Upgrade of latrines for children with special needs	MoE-owned and Rented schools	3265	1,044,800

SUB-TOTAL COST	374,345,547
Estimated administrative cost (20% of total cost)	74,869,110
<b>GRAND TOTAL COST</b>	<b>449,214,657</b>

**Cross-Cutting Recommendations**

1. Consider indirect effects of intervention

The availability of protection walls as well as the level of activeness regarding hygiene promotion are linked with the level of maintenance of facilities. This indicates the possibility that such interventions being bundled together would synergize to reduce the budget of school facilities maintenance.

2. Target a large number of schools

Multiple problems are experienced in a large number of schools. It is recommended to target a common problem in a large number of schools..

3. Target both urban and rural

There are more problems in urban schools than that in rural schools mainly because of the large number of students and the lack of space in urban areas, however, due to the scattered location of schools in rural area, the lack of learning space and malfunctioning facilities could have larger impact on the inaccessibility to education for children in rural areas. Therefore, schools in rural areas should not be left out.

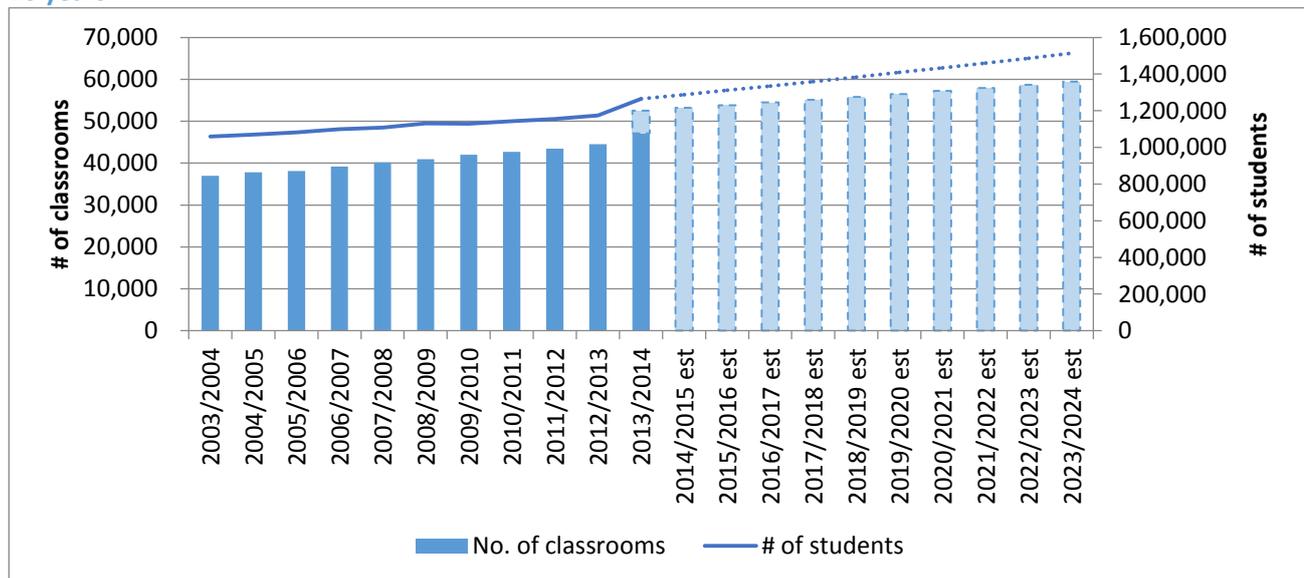

4. Prioritize new spaces

Rented schools have a lower priority than MoE-owned schools in terms of maintenance and improvement due to the restriction of interventions and the ineffectiveness of working on any facilities which will not become MoE’s asset.

Most rented schools are basic schools, which imply that younger children have been exposed to risks due to malfunctioning facilities. As the above-mentioned cost estimates show, most hardware work cannot be target toward rented schools. In this sense, the total cost estimated (JD 506,898,566) would not resolve problems in rented schools and the 132,016 children attending rented schools would be excluded from benefiting from the work.. The only way to resolve the inappropriate facilities in rented schools would be to construct new schools and reallocate students from the rented schools to the new schools.

In addition, approximately half of overcrowded schools have no available space to construct even one additional classroom. Considering the average increase in student populations over the past 10 years, an additional 6,886 classrooms, or/at 529 schools are required in next 10 years based on the MOE standard space per children.

**Figure 122 Expected number and growth of students in Jordan and required number of classrooms in the next 10 years**

## Conclusion

To continue its effort, in this direction JEN is planning in partnership with MoE, UNICEF and UNESCO to conduct update of the assessment in mid-2016 taking into account lessons learned from this assessment with the objective to improving capacities in data processing, storage, analysis as well as providing updates of educational management information in order to facilitate and promote the use of relevant information by various agencies and individuals at all levels for more effective educational planning, implementation and management and to streamline the flow of information for decision-making by reducing duplications as well as filling in information gaps.

## ANNEX: DATA COLLECTED

### 1. Schools

Table 3 Number of schools by governorate

# of Schools per governorate	Ajlun	Al Balqa'	Amman	Aqaba	Irbid	Jarash	Karak	Ma'an	Madaba	Mafraq	Tafilah	Zarqa	Total	%
